Introduction to Software Engineering and Modelling

Jörg Kienzle

Overview

- What is Software Engineering?
- Software Development Processes
- Software Development Phases
- Model-Driven Engineering
- Object-Orientation
- UML
- Overview of Process we will use
  - Background on Fondue, Fusion, etc...
  - Overview of Models that we will build
- Example Models for Settlers of Catan

What is Software Engineering

- Software:
  - Computer programs, procedures, and possibly associated documentation and data pertaining to the operation of a computer system

According to the IEEE

- Software Engineering:
  - The application of a systematic, disciplined, quantifiable approach to the development, operation, and maintenance of software
  - In other words: the application of engineering to software

Increasing Complexity

- Scope, complexity and pervasiveness of computer-based and controlled systems continue to increase
- Software assumes more and more responsibility

Challenges for SE

- 1960's: Cope with software correctness
  - Milestone: Floyd 'assigning meaning to programs'
- 1970's: Cope with project size
  - Milestone: Parnas, Yourdon: modularity & structure
- 1980's: Cope with variability in requirements
  - Milestone: Jackson, Meyer: modeling, object orientation
- 1990's: Cope with distributed systems and mass deployment:
  - Milestone: Szyperski: product-lines & components
- 2000's: pervasive software integration, system of systems, accelerating technological changes
  - Milestone: ?

Long-Term Availability

- AIRBUS A300 Life Cycle
  - Program began in 1972, production stopped in 2007
  - 2007-1972 = 35 years...
  - Support will last until 2050
    - 2050-1972 = 78 years !!

Dependability

- Consequences of systems failing
  - Annoying to catastrophic
  - Opportunities lost, businesses failed, security breaches, systems destroyed, lives lost

On June 4, 1996 an Ariane V rocket launched by the European Space Agency exploded just forty seconds after lift-off

Software Development Process

- A well-defined and well-managed software engineering process
  - Provides guidance as to the order of a team's activities,
  - Specifies what artifacts should be developed,
  - Directs the tasks of individual developers and the team as a whole, and
  - Offers criteria for monitoring and measuring a project's products and activities.

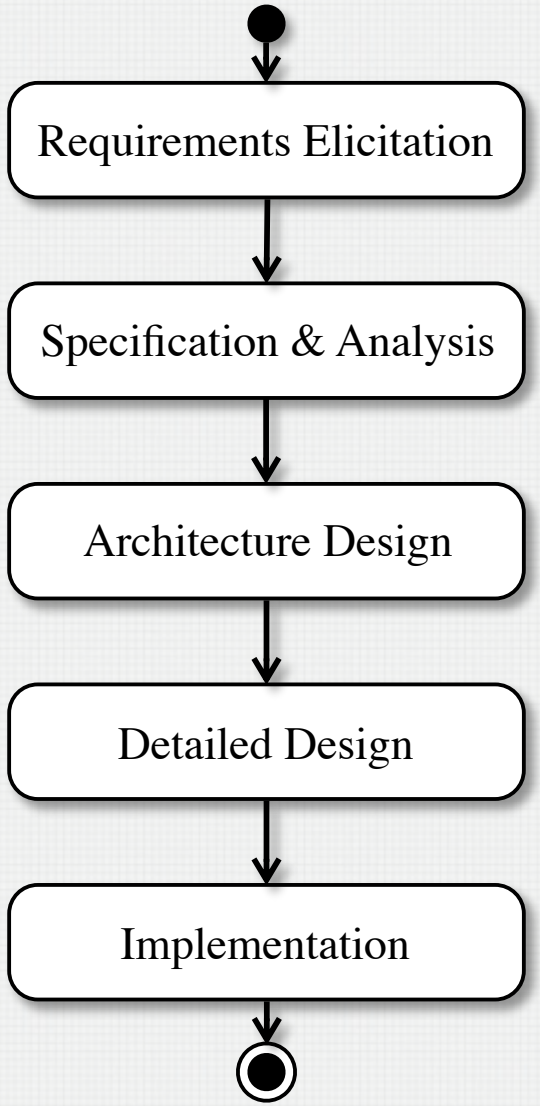
Software Process Activities

- Primary activities
  - Development
  - Operation
  - Maintenance
- Supporting activities
  - Documentation
  - Configuration management
  - Quality assurance
  - Verification and validation
  - Training
- Process-related activities
  - Management
  - Infrastructure
  - Tailoring
  - Process assessment

Systematic guidance on how to do this is called a development method

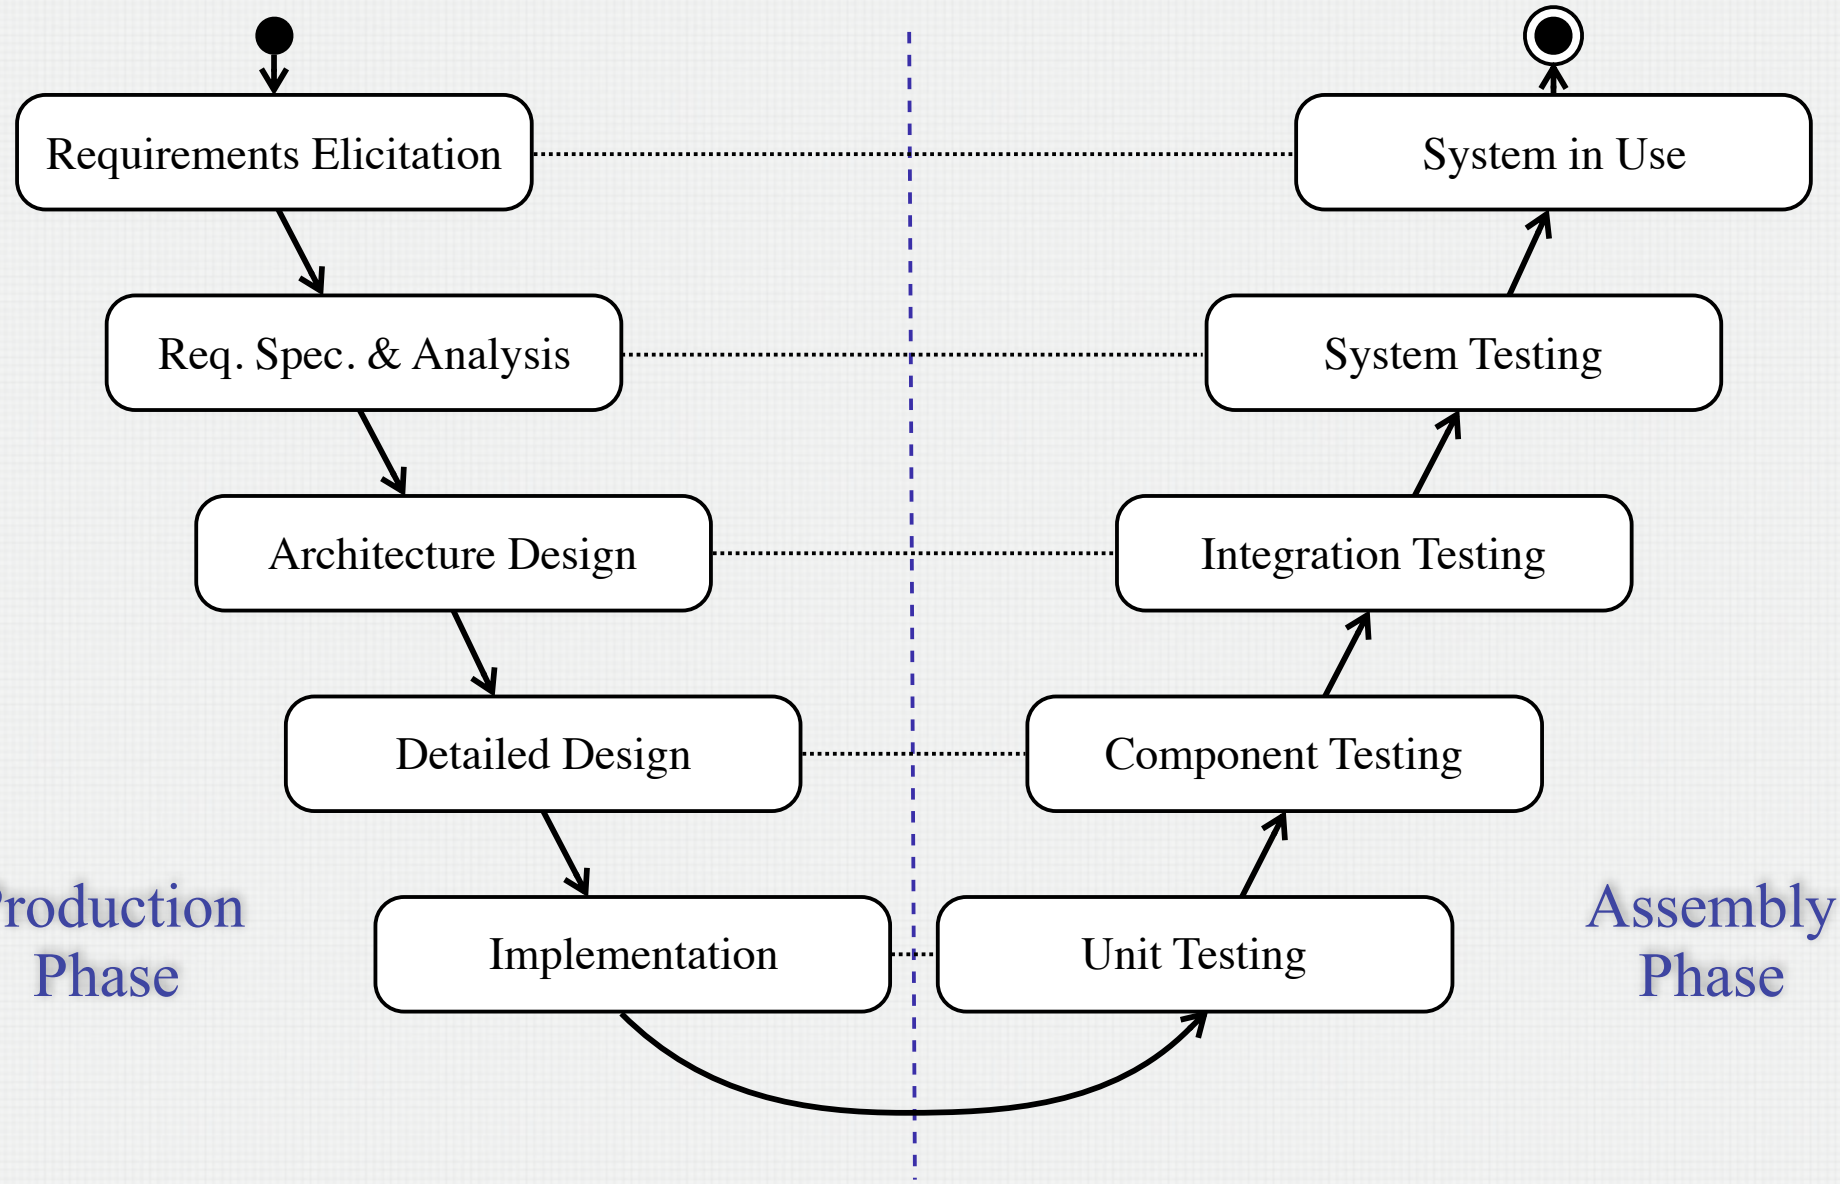
We will focus on this!

Classic Waterfall Model



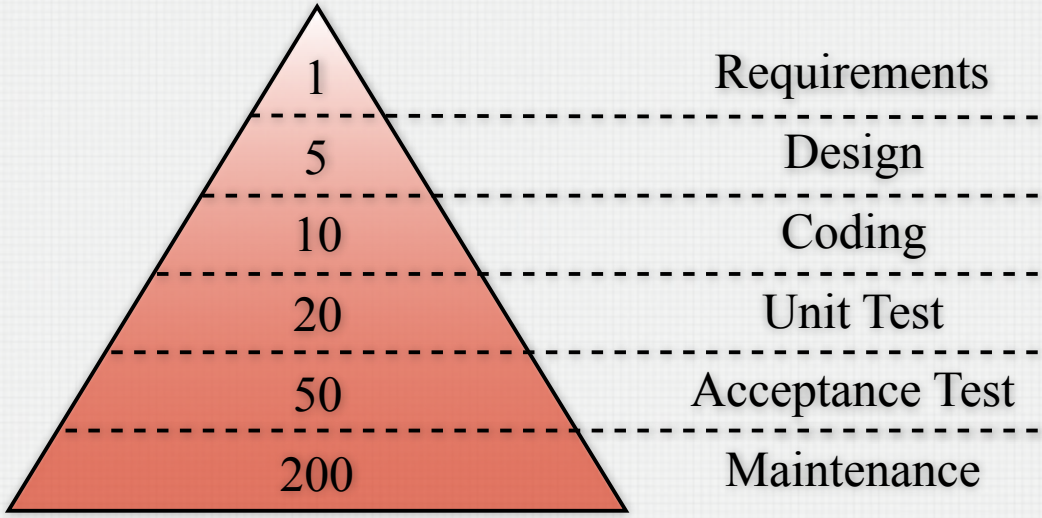
Why?	Discover functionality / user expectations Non-functional requirements / qualities
What?	Produce a complete / unambiguous description of the problem domain and the requirements
How?	Elaborate a system architecture that fulfills the requirements
How exactly?	Allocate responsibilities to modules Design how functionality is achieved at run-time
	Elaborate low-level algorithms Implement your modules

Software Development V Model



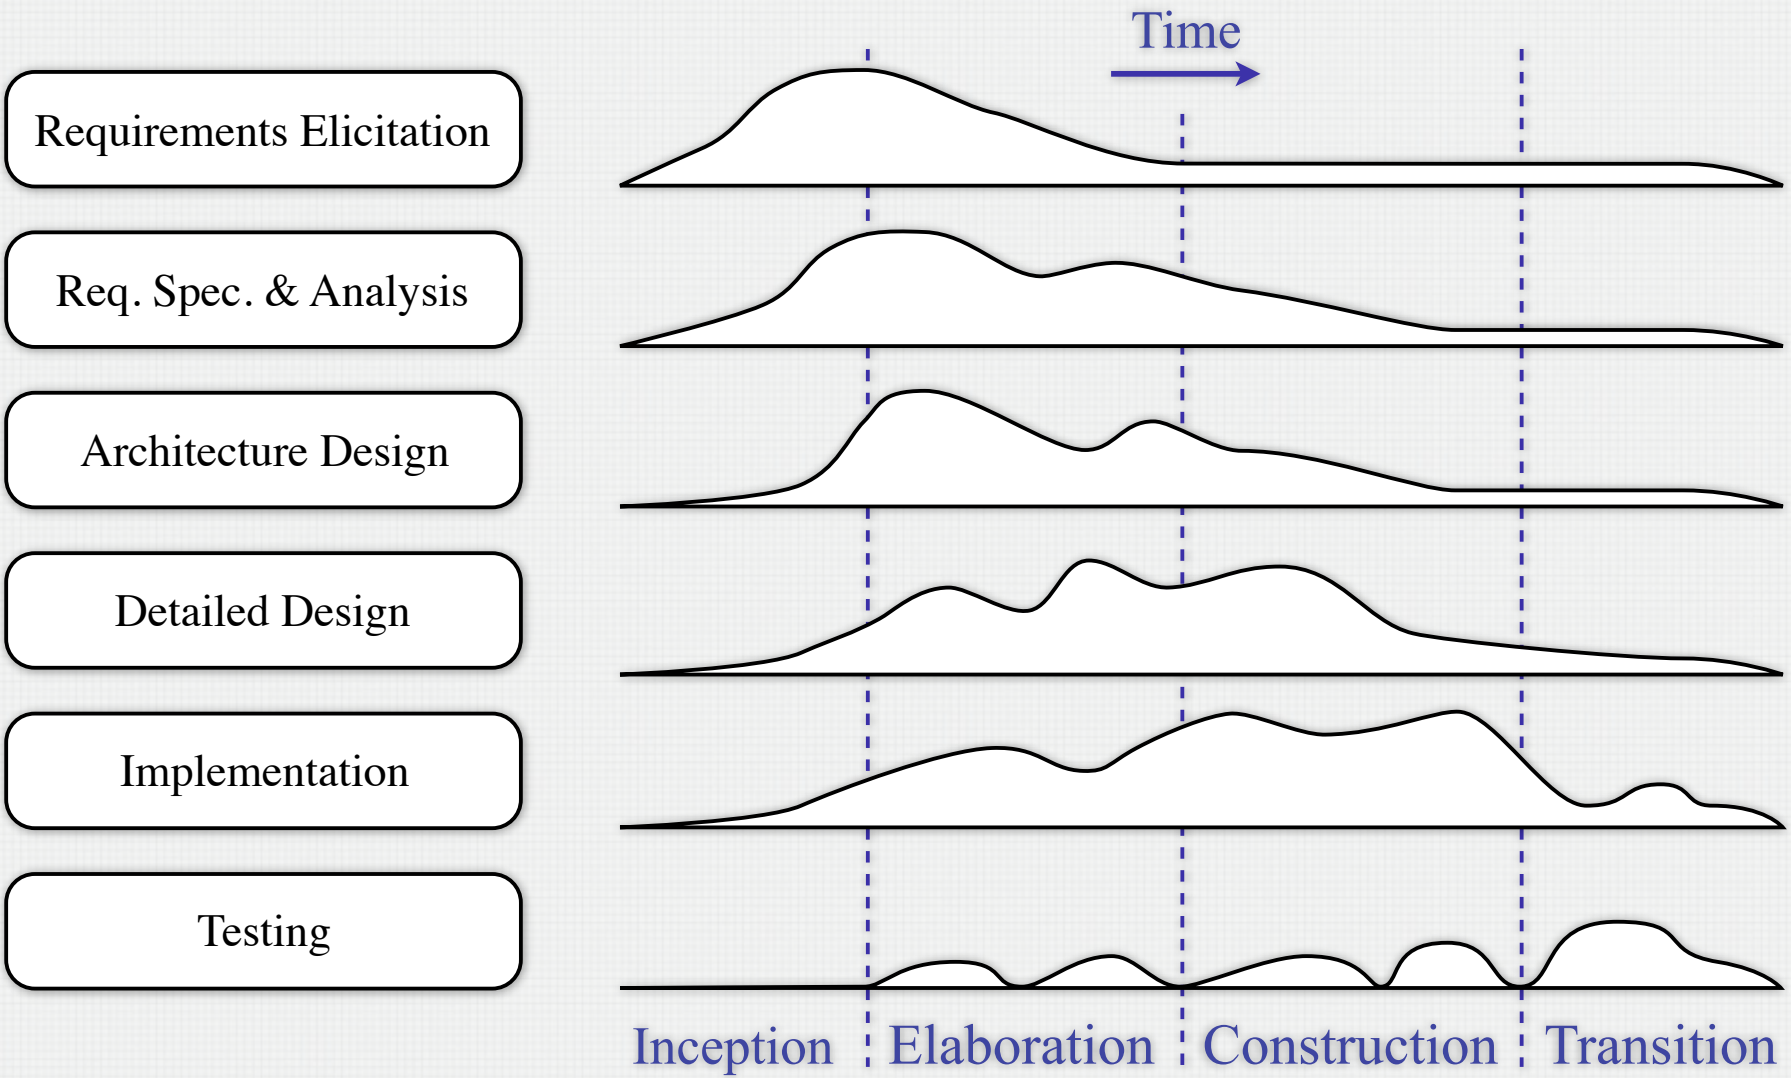
Importance of "Good" Requirements

- Faults / omissions made at the requirements stage are expensive to fix later
  - Stated requirements might be implemented, but the system is not one that the customer wants
- Need to determine and establish the precise expectations of the customer!

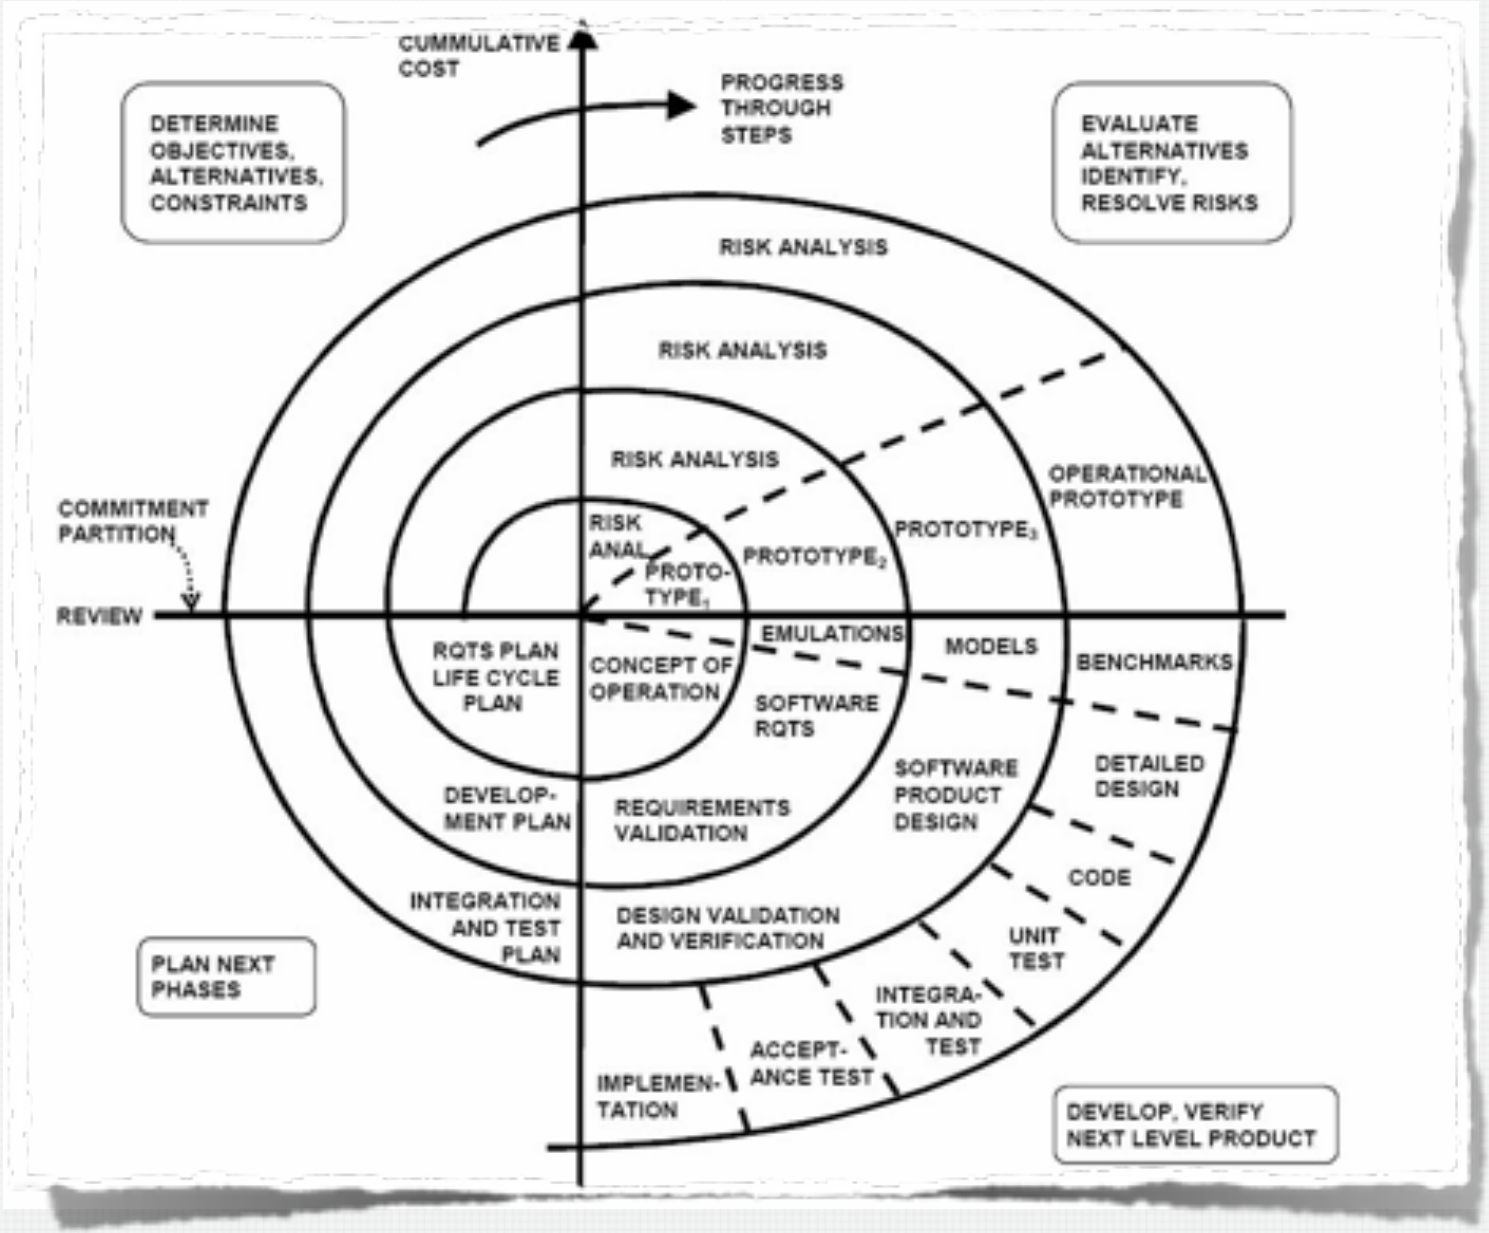


Relative Cost to Repair a Defect
at Different Lifecycle Phases [Davis 93]

Iterative Software Development



Spiral Methodology



Decomposition in SE

- Vertical Decomposition
  - Decomposition according to layers of abstraction
    - That is what MDE is all about
    - From domain / problem-layer down to solution / platform-specific layer
    - Domain models belong to the domain / problem layer
  - Can be done
    - Top-down, when starting with requirements, or
    - Bottom-up, when abstracting away from implementation details
- Horizontal Decomposition
  - Within a layer of abstraction, from one software development iteration to the next
    - Additional functionality is considered
    - Existing artifacts are adapted / extended to support new functionality
    - Increments can be based on addititional scenarios, additional features, additional qualities, etc…

Why Modelling?

"Modeling, in the broadest sense, is the cost-effective use of something in place of something else for some cognitive purpose. It allows us to use something that is simpler, safer or cheaper than reality instead of reality for some purpose."

Jeff Rothenberg
The Nature of Modeling
John Wiley & Sons, August 1989

Why Modelling?

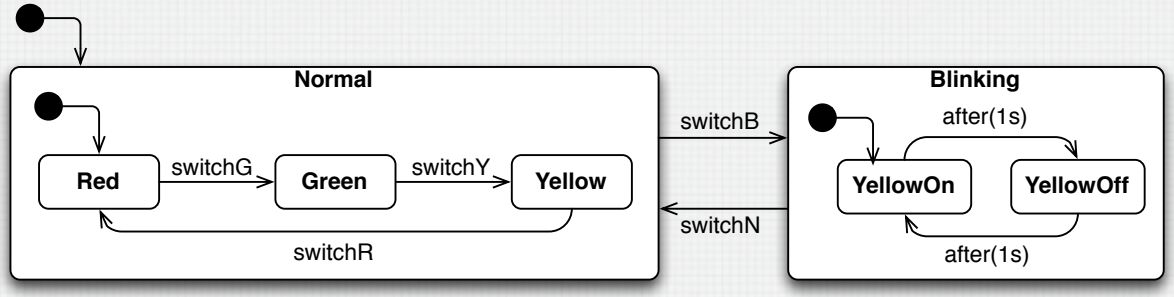
"A model represents reality for a given purpose; the model is an abstraction of reality in the sense that it cannot represent all aspects of reality. This allows us to deal with the world in a simplified manner, avoiding the complexity, danger and irreversibility of reality."

Jeff Rothenberg
The Nature of Modeling
John Wiley & Sons, August 1989

Modelling and Software Development

- A Model is a simplified representation of an aspect of the world for a specific purpose
- We use models to better understand a system
  - For a observer A, M is a model of an object O, if M helps A to answer questions about O. (Minsky)
- A model helps to understand, communicate and build
- Modelling and engineering: model something not yet existing!

M1 - Modelling Space



M0 - The World

Model-Driven Engineering

- A unified conceptual framework in which software development is seen as a process of model production, refinement and integration
- Models are at the centre of the development activities
  - Models are built representing different views of a software system using different formalisms, i.e., modelling languages, at different levels of abstraction, for different purpose
  - Models are connected by model transformations
    - High-level specification models are refined / combined / transformed to include more solution details until the produced models can be executed
- Tools are of major importance to effectively create, manipulate and transform models

Use Case Diagram

Use Case: TakeElevator
Scope: Elevator Control System
Primary Actor: User
Intention: The intention of the *User* is to take the elevator to go to a destination floor.
Level: User Goal
Main Success Scenario:
1. *User* **Call[s]Elevator**
2. *User* **Ride[s]Elevator**

Extensions:
1a. Cabin is already at *User's* floor…
1b. *User* is already inside…

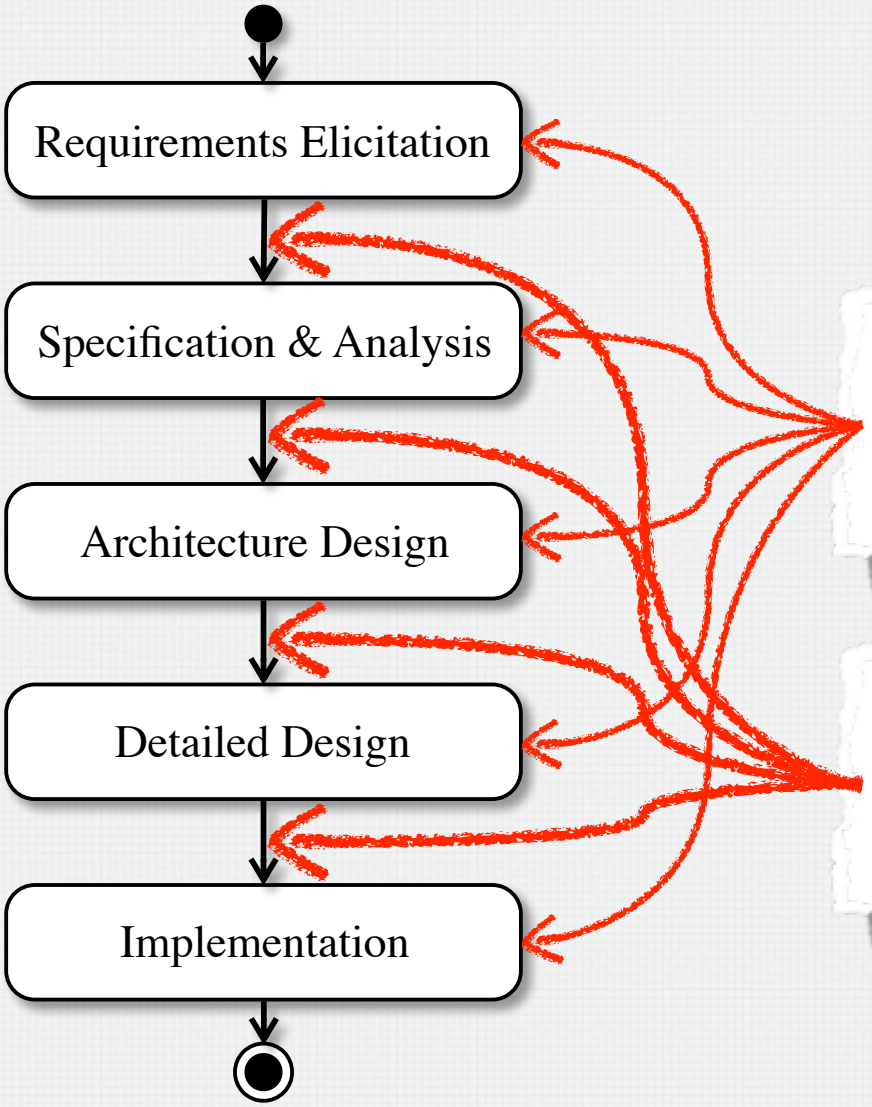
  public void moveAsteroid() {
    xPos = xPos - speed;
  }

  public boolean outOfBounds() {
    return xPos < 0;
  }
}
```

Java Code

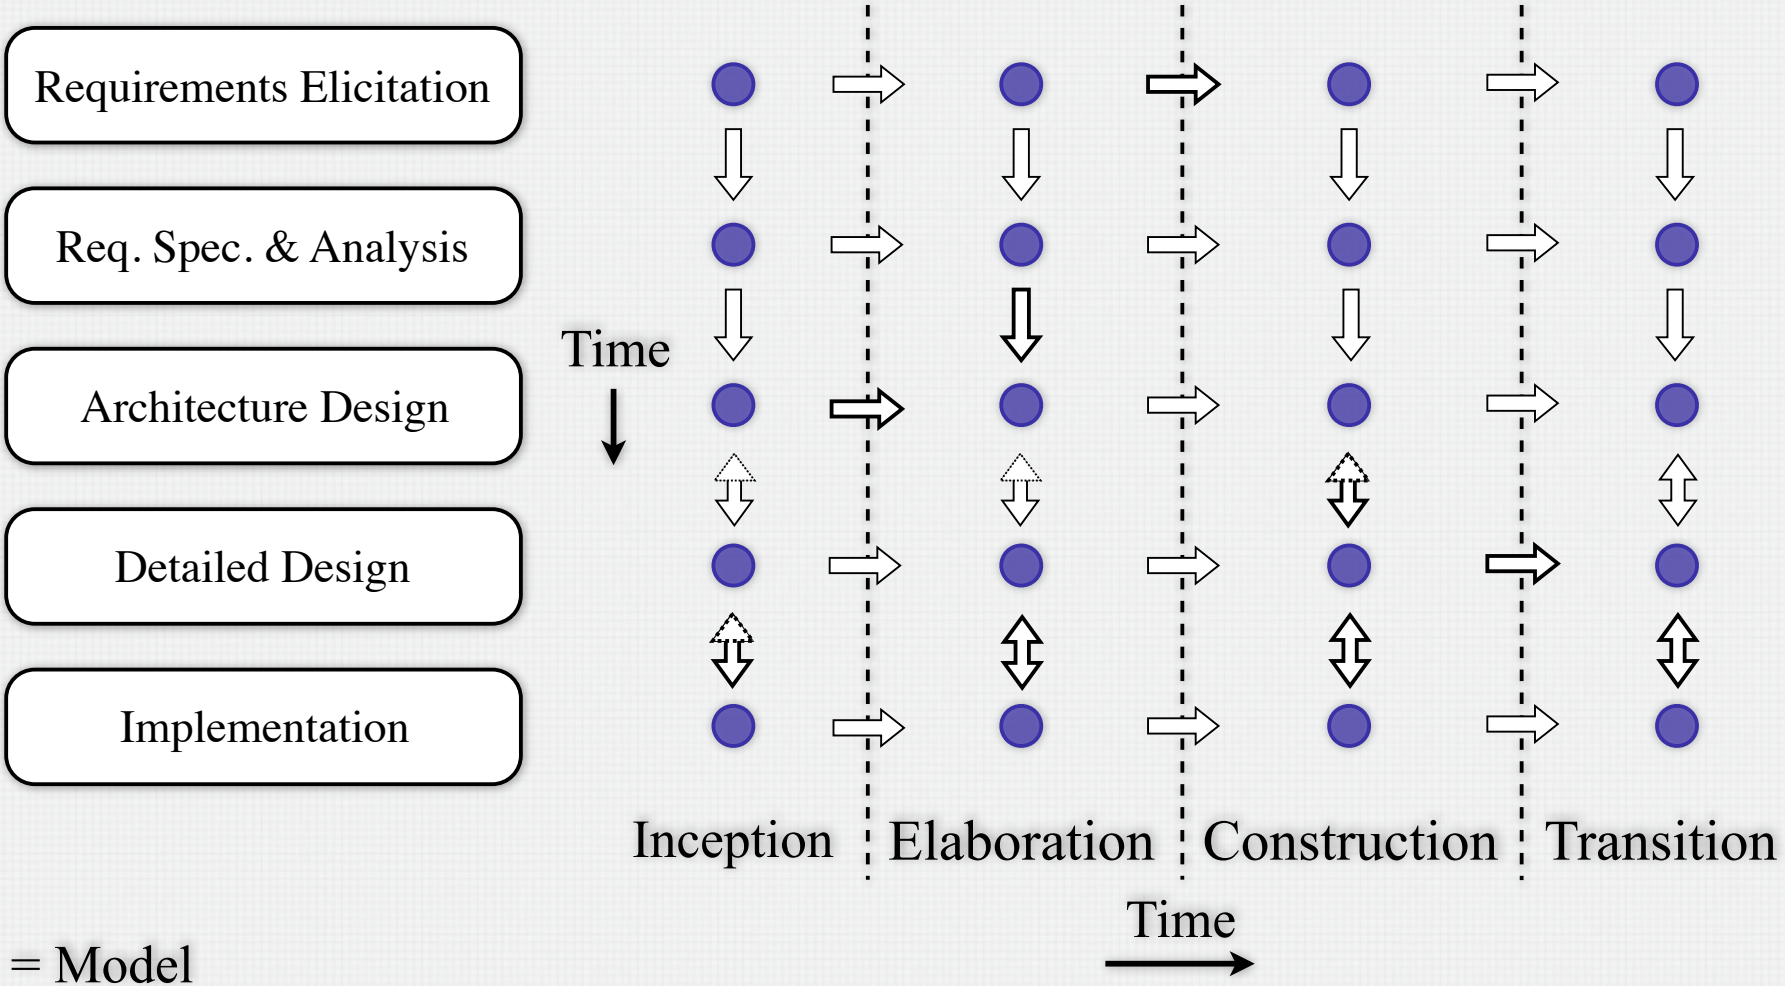
Model-Driven Engineering



Models are created at the right level of abstraction using the most appropriate modelling formalism

Model transformations map models at one level to models at another level of abstraction

Modern MDE



● = Model

⇨ = Refinement / Model Transformation

⇔ = Tool Support / Automated

On Modelling

- The choice of models and diagrams has a profound influence upon how a problem is attacked and how a corresponding solution is shaped
- Abstraction is a key to learning and communicating
- Every complex system is best approached through a small set of nearly independent views of a model; no single view is sufficient
- Every aspect of a system may be expressed at different levels of abstraction / fidelity

Object-Orientation

- Object-orientation is based on old principles
  - Abstraction
  - Information hiding and encapsulation
  - Modularity
  - Classification
- Object-orientation is based on a few concepts
  - Object
    - Groups together state and behaviour
  - Class
  - Inheritance
  - Polymorphism

Object-Orientation and SE

- Object-Orientation stems from object-oriented programming, but can be applied within the whole software development life cycle
  - Requirements Elicitation and Specification
  - Design
  - Implementation
  - Testing

Experience has shown that OO alone is not enough!

- Object-Orientation is a way of thinking about problems using models organized by real-world entities
- Object-Orientation is an engineering method used to create a representation of the problem domain and map it into a software solution

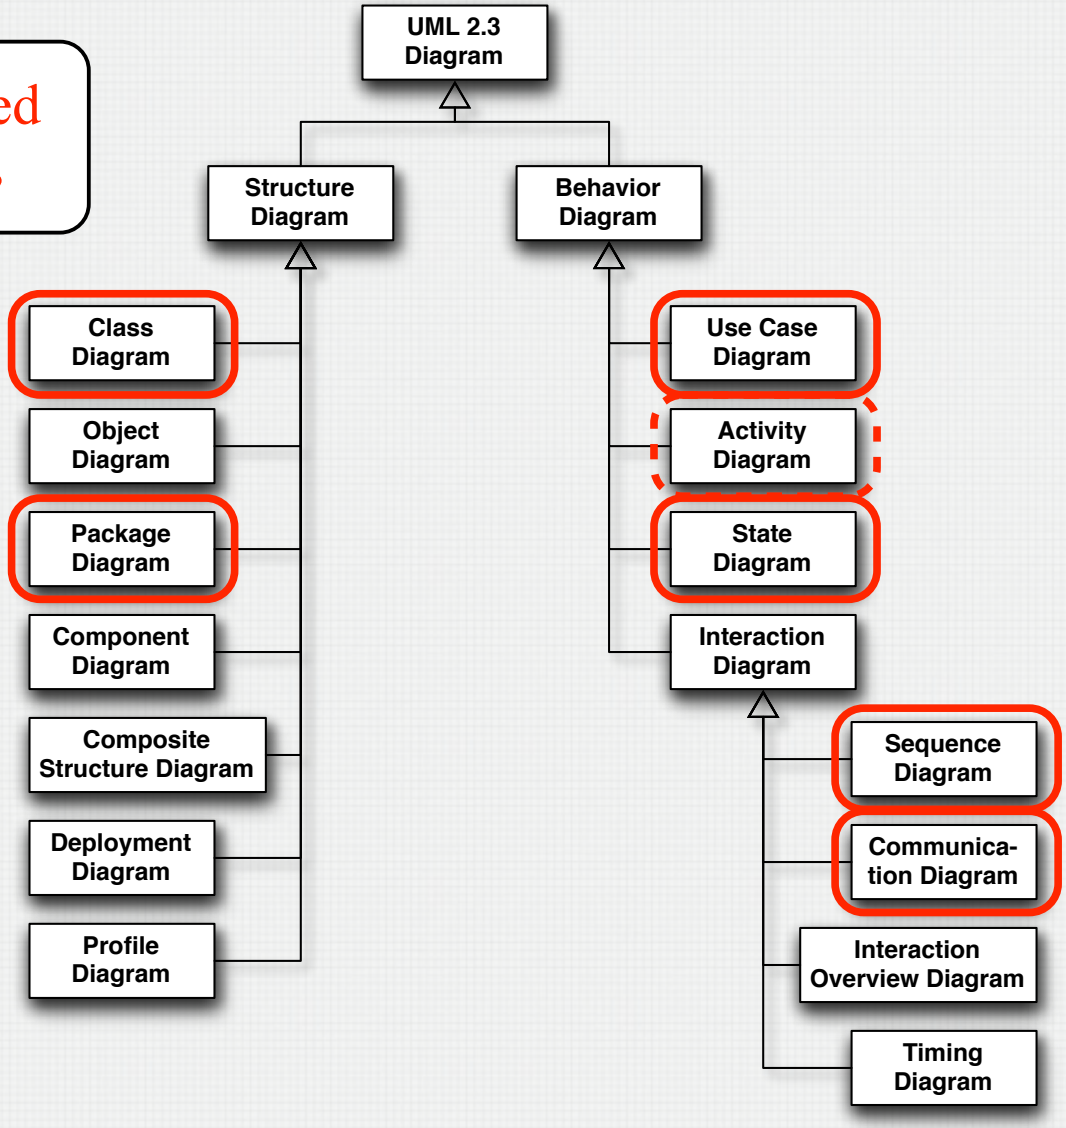
Scope of UML

- The Unified Modeling Language (UML) is a language for specifying, constructing, visualizing, and documenting the artifacts of a software-intensive system

- UML fuses the concepts of the Booch, OMT, and OOSE methods
- UML is a single, common, and widely usable modelling language
- UML incorporates the object-oriented community's consensus on core modelling concepts
- UML allows deviations to be expressed in terms of its extension mechanisms
- Current version: UML 2.5

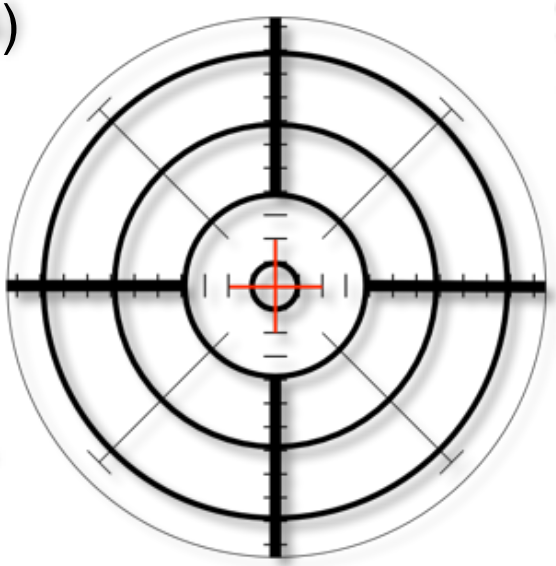
UML Diagrams

Notations Used in this Class

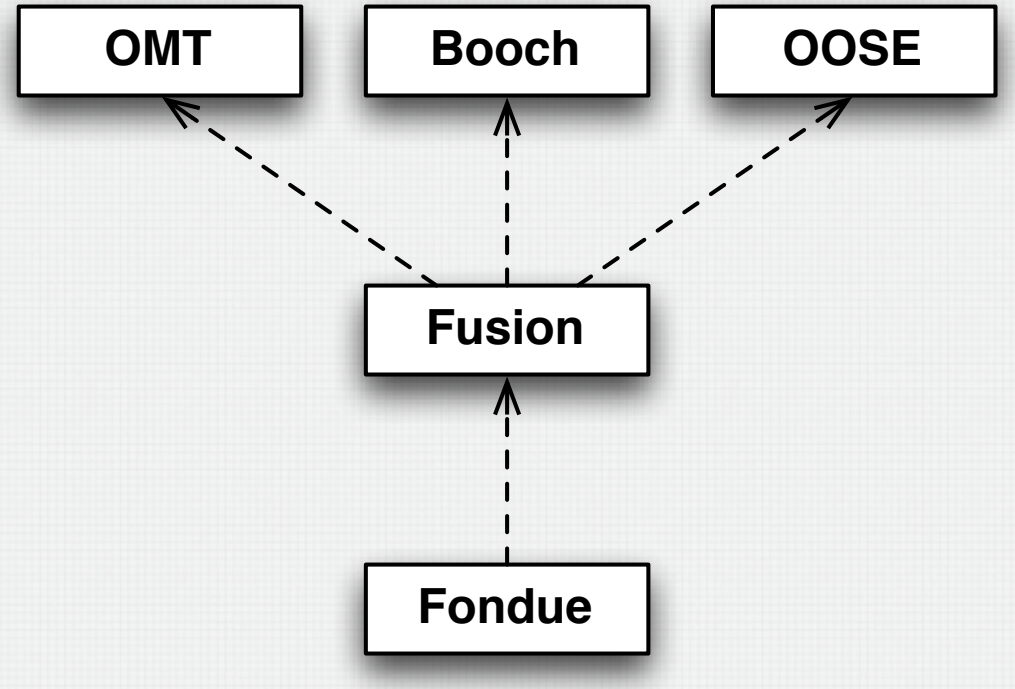


Outside the Scope of UML

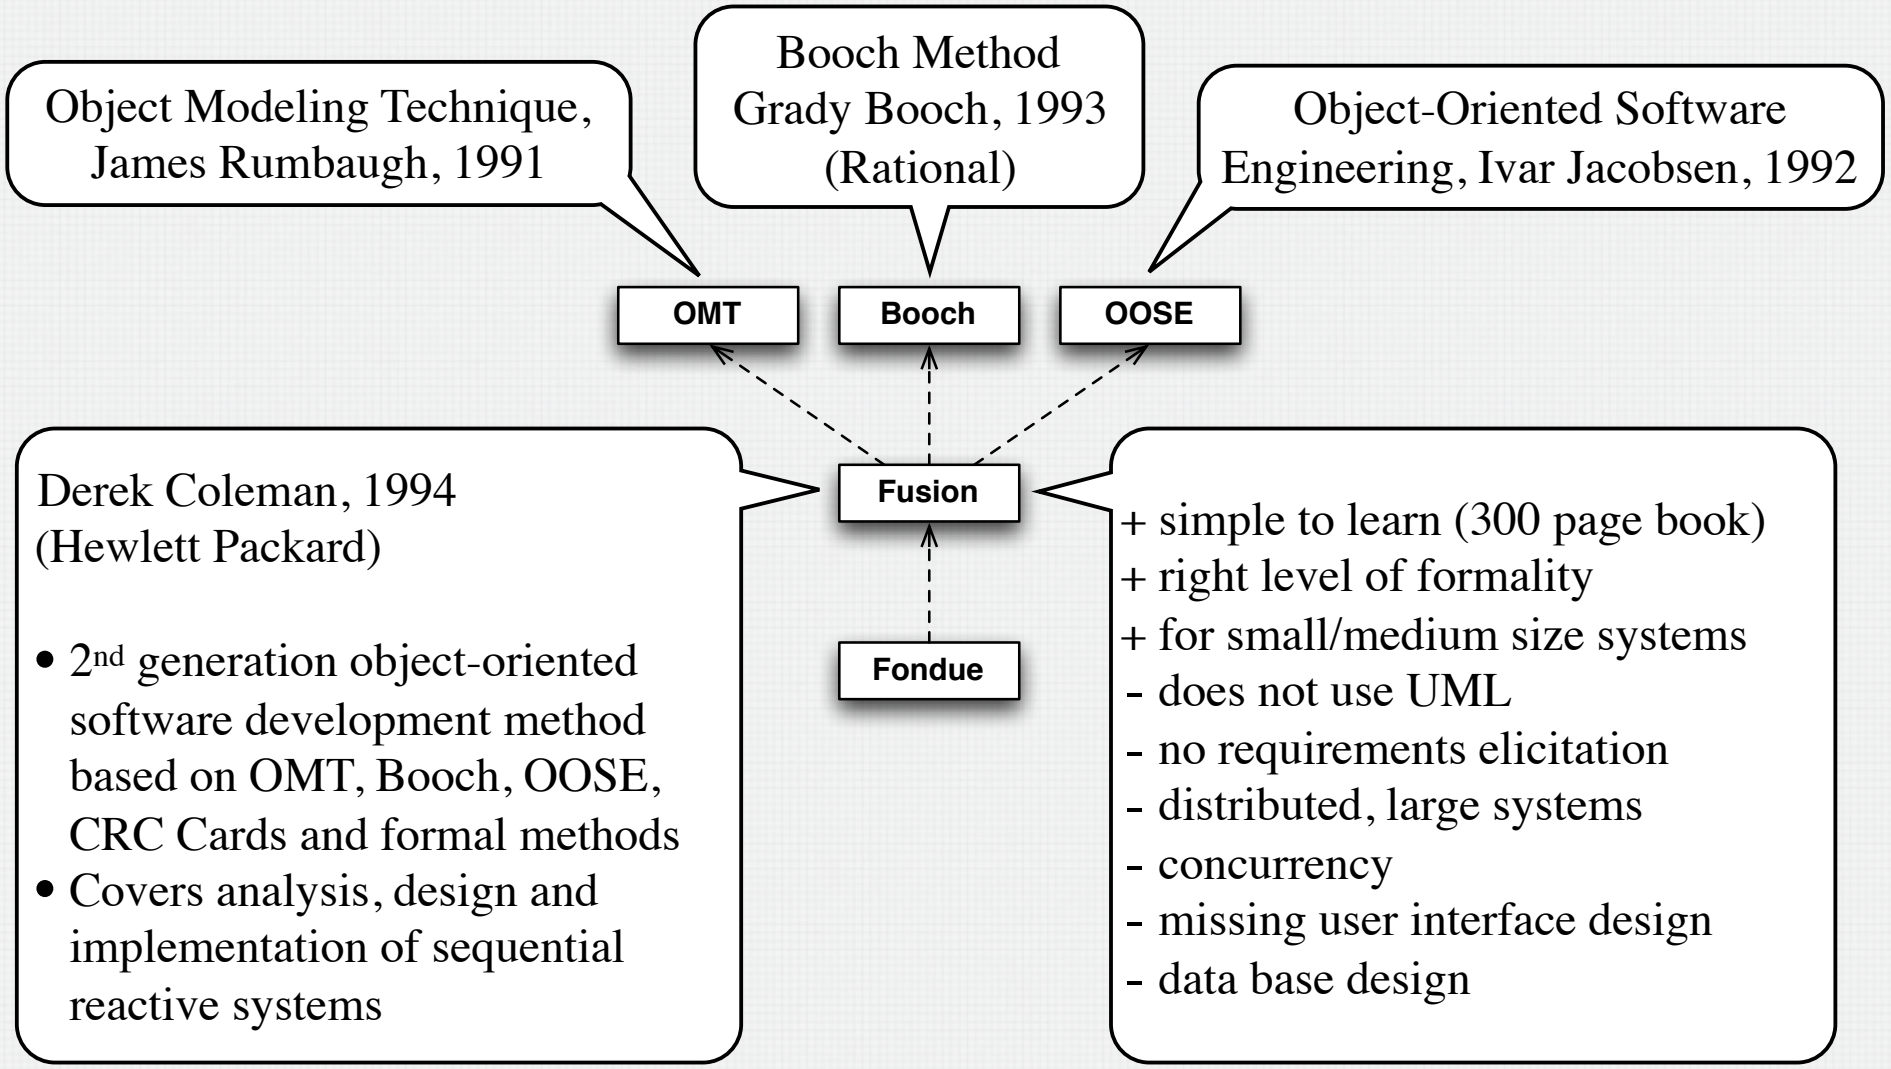
- Programming Languages
  - UML is not intended to be a visual programming language
- Tools
  - UML does not define a tool interface, storage, or run-time model (which could be used by CASE tool developers)
- Process
  - UML is intentionally process independent
  - Processes by their very nature must be tailored to the organization, culture, and problem domain at hand
  - What works in one context would be a disaster in another
  - The selection of a particular process will vary greatly, depending on such things like problem domain, implementation technology, and skills of the team



Methods We're Using



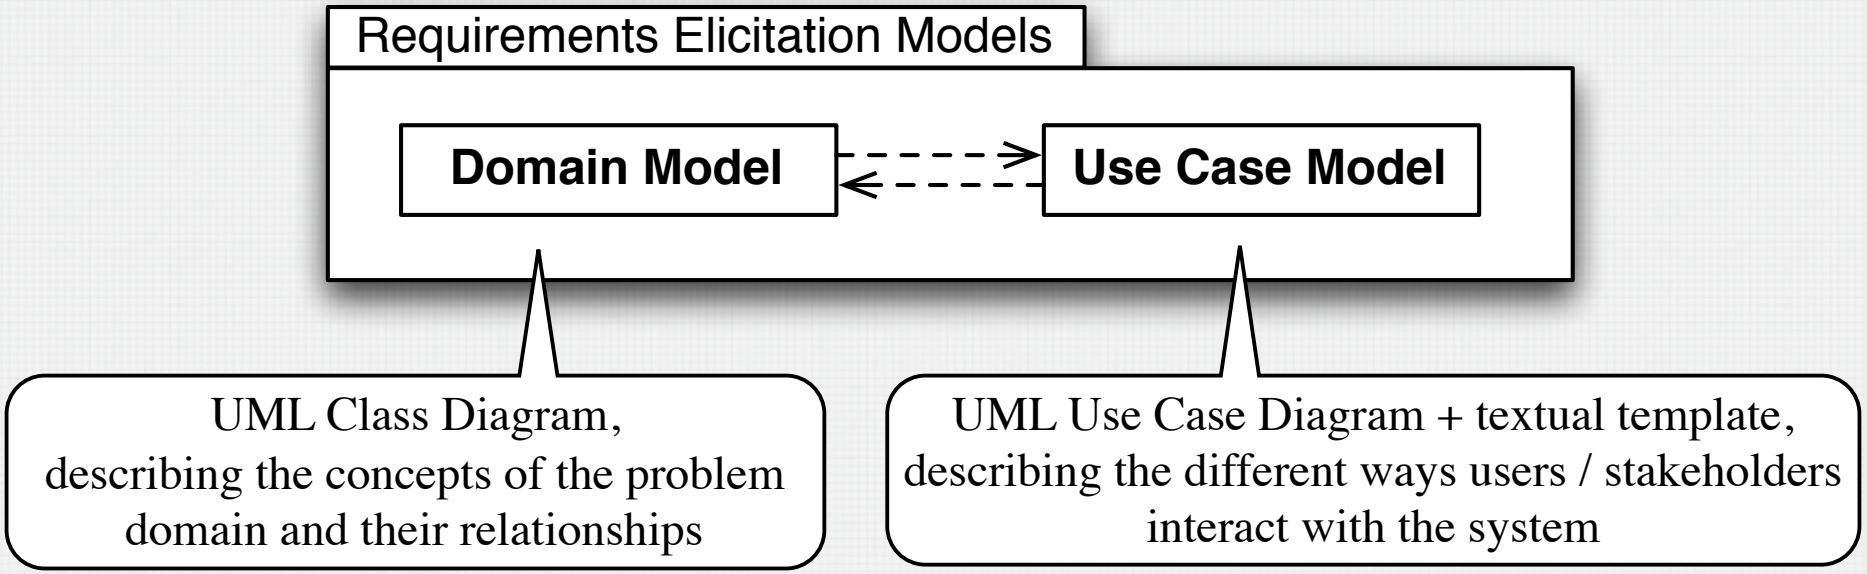
History of Fondue



What is Fondue?

- Fondue is a development method that extends the process and the models of the original Fusion method
- Fondue uses the UML notation
- Use cases are used during requirements elicitation
- Operations are specified formally in operation schemas by pre- and postconditions using the OCL
- Fondue follows the philosophy of model-driven engineering
  - For example: the domain model is refined into a concept model, then into a design class model and finally an implementation class model

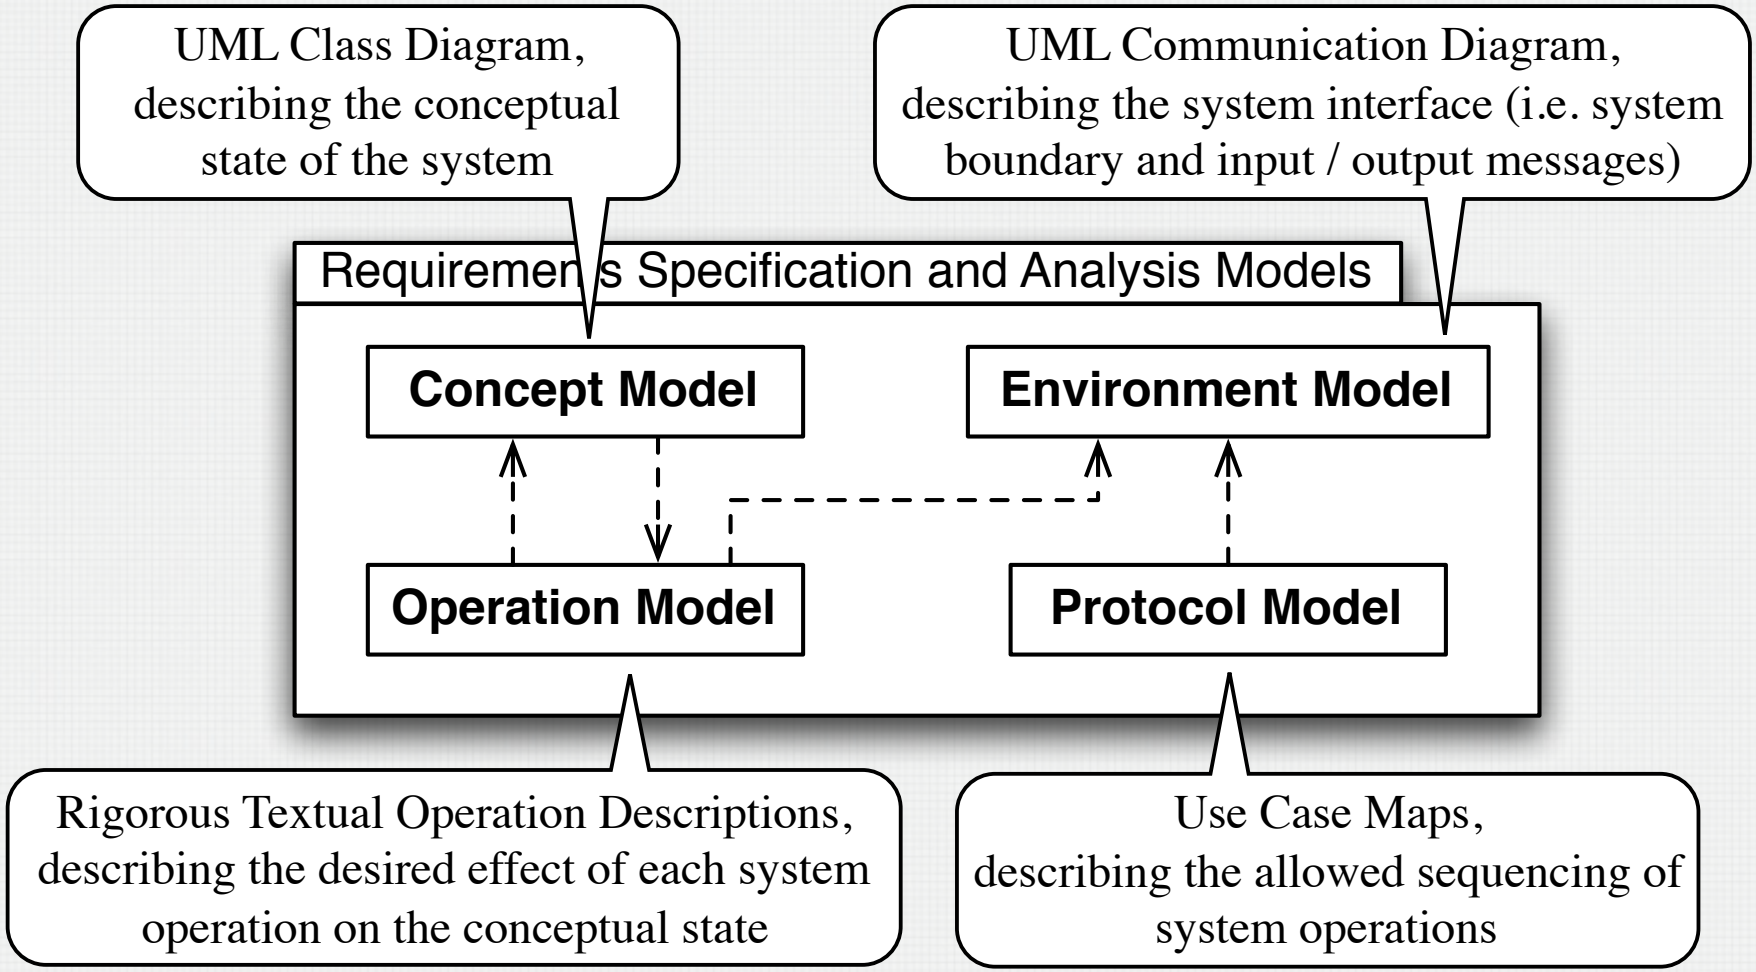
Fondue Models: Requirements Elicitation



Requirements Specification / Analysis

- The analyst defines the intended behaviour of the system
- Models are produced, which describe
  - The concepts that exist in the system.
  - The relationships between concepts.
  - The boundaries of the system.
  - The operations that can be performed on the system.
  - The allowable sequences of those operations.
- Fondue does not attach the operations to particular classes during analysis.

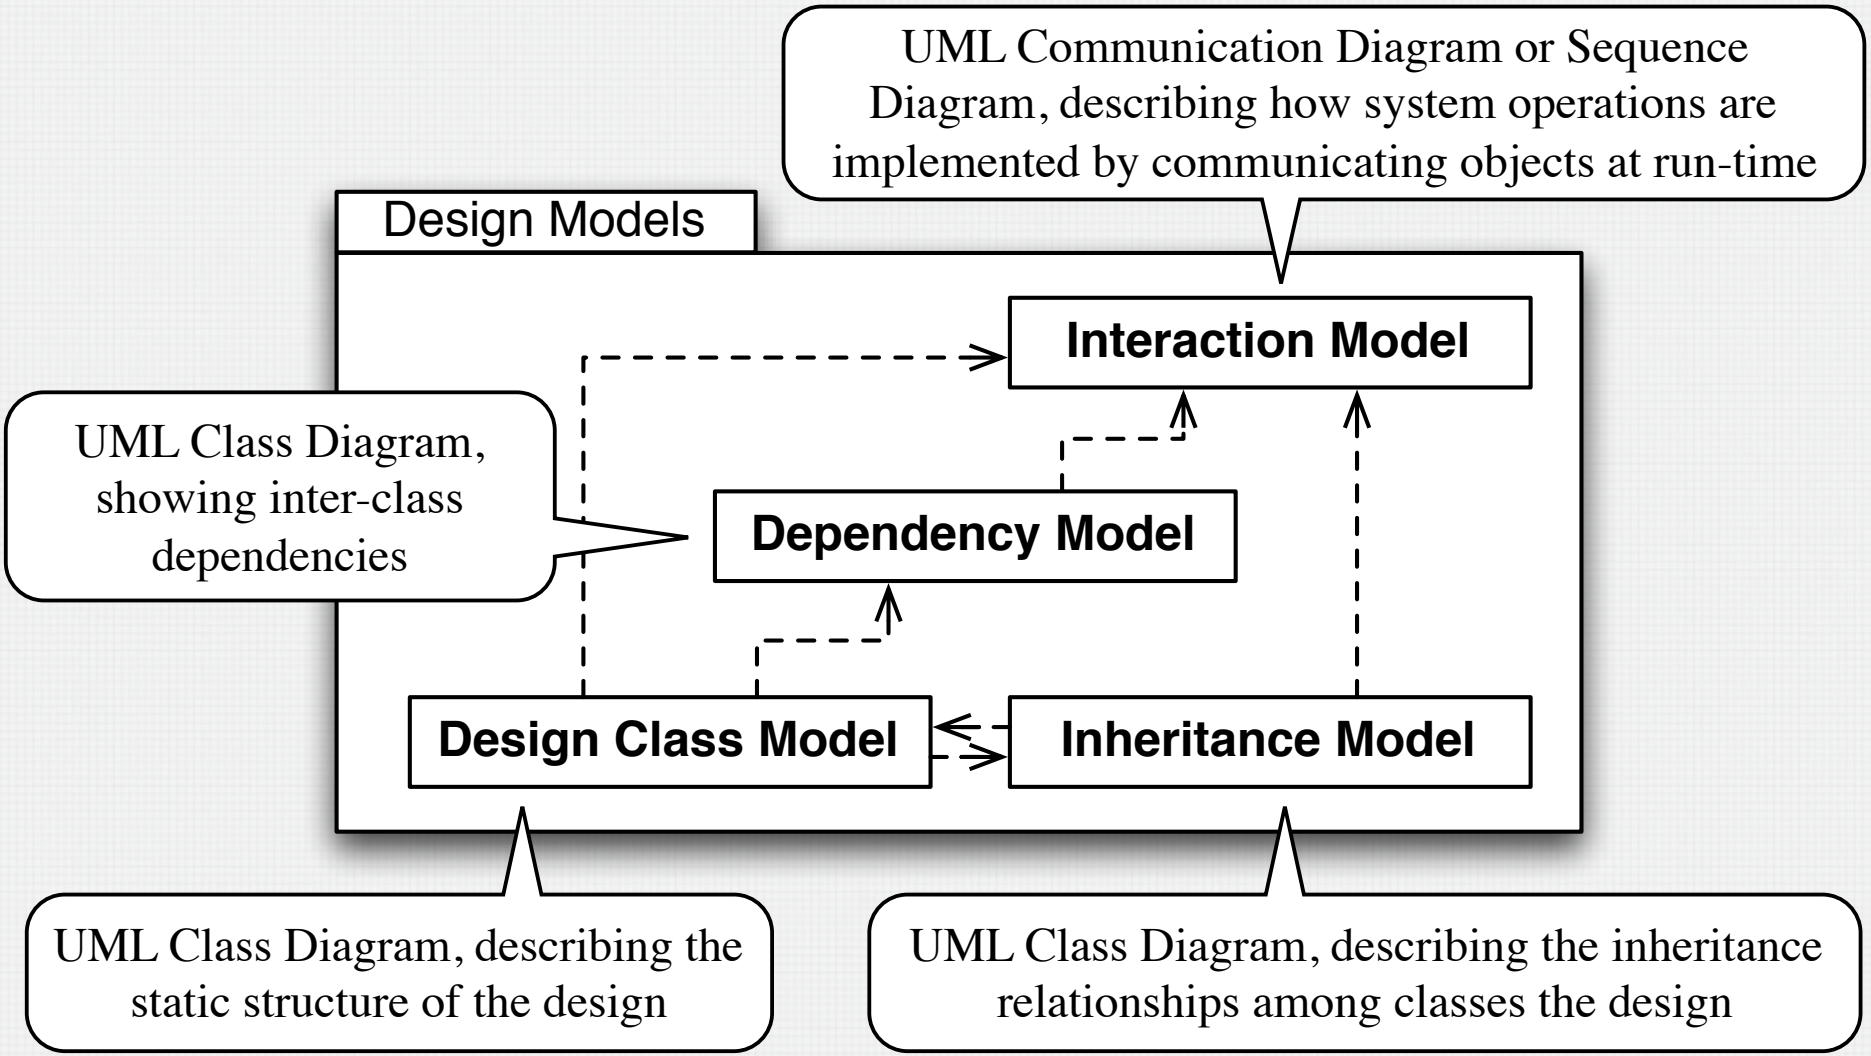
Fondue Models: Requirements Spec.



Design Activities

- The designer chooses how the system operations are to be implemented by interacting objects at run-time.
- Different ways of breaking up a system operation into interactions can/should be tried.
- The operations are attached to classes.
- The design phase delivers models that show:
  - How system operations are implemented by interacting objects.
  - How classes refer to one another (in order to achieve interaction).
  - How classes are related by inheritance.
  - The attributes and methods of classes.

Design: How?



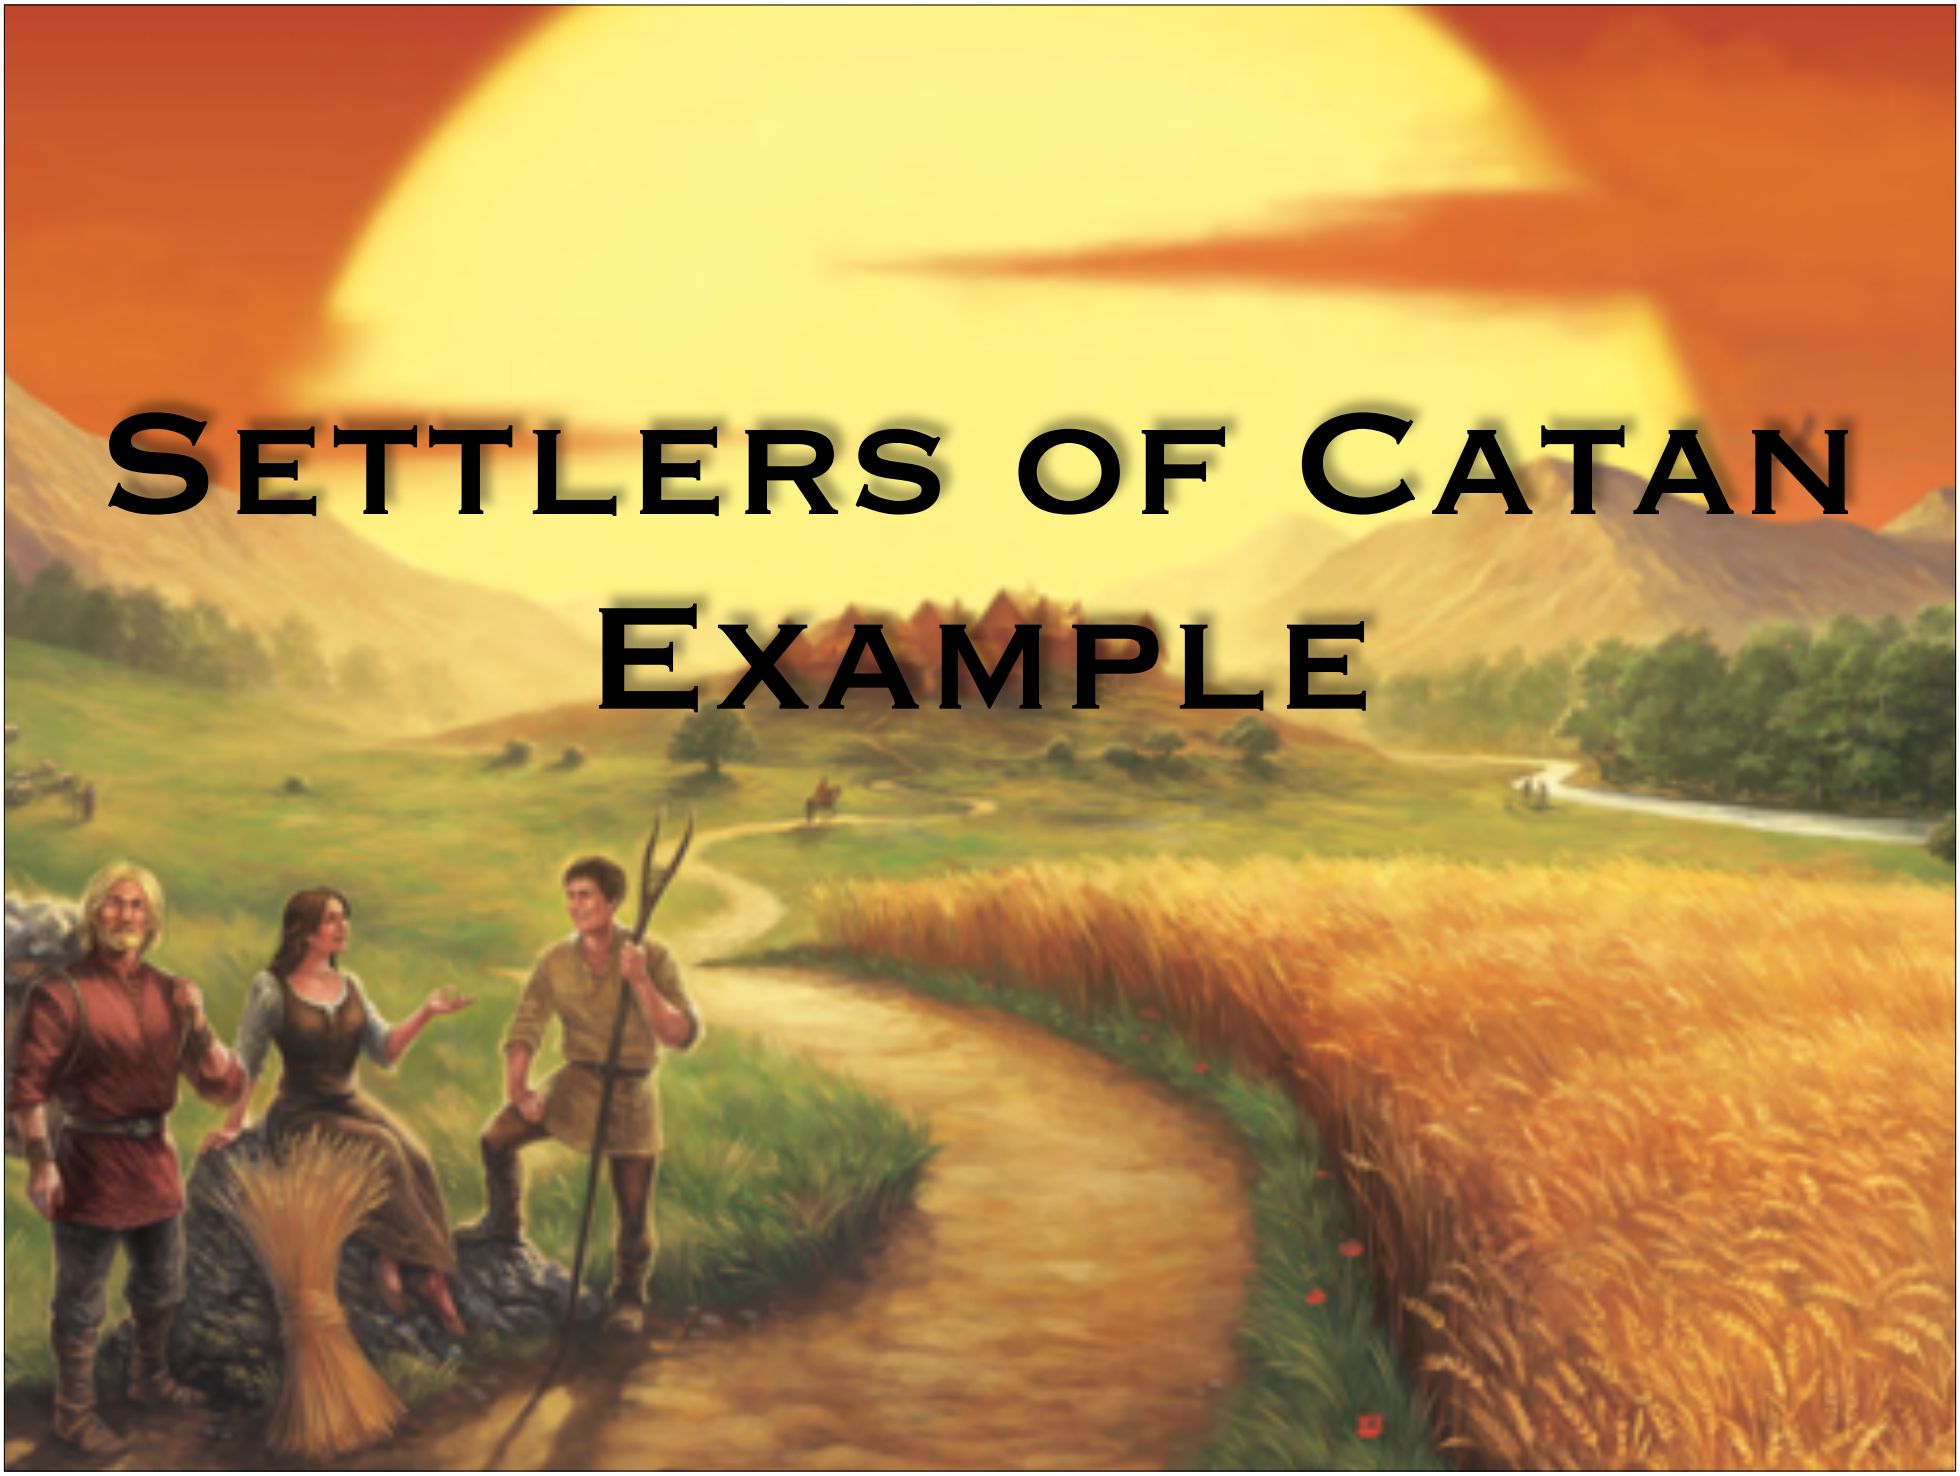
UML Communication Diagram or Sequence Diagram, describing how system operations are implemented by communicating objects at run-time
Design Models
Interaction Model
UML Class Diagram, showing inter-class dependencies
Dependency Model
Design Class Model
Inheritance Model
UML Class Diagram, describing the static structure of the design
UML Class Diagram, describing the inheritance relationships among classes the design

Stepwise Refinement

- Initially, some classes end up with lots of responsibilities
  - Designers may need to investigate the substructures of some classes and their operations
- Hierarchical decomposition is used
  - The class is regarded as a subsystem
  - The analysis and design phases are applied to the subsystem
- Commonalities between classes are discovered
  - Inheritance is used to refactor common structure and behaviour

Implementation: Build It

- The design is mapped to a particular programming language.
- Fondue provides guidance on how this is done:
  - Inheritance, attributes, and methods are implemented in classes (if the construct is provided by the programming language).
  - Object interactions are implemented as calls to methods belonging to classes.
  - The permitted sequences of operations are recognized by a finite state machine.
- Result: Implementation Class Model (Class Diagram / Text / Code)



Settlers of Catan
Example

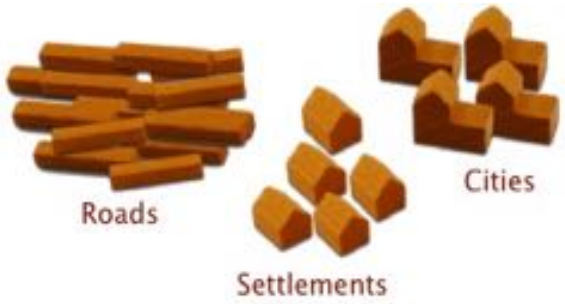
Quick Game Overview

- The base game is played on a board of 19 hexagons
  - Hex fields produce resources: brick, lumber, wool, grain and ore
  - Each hex field has a number (between 2 and 12) on it
- Players build settlements on intersections, i.e., adjacent to 3 (or 2) hexes
  - Each player starts with 2 settlements
  - Upon rolling the dice, every hex with the corresponding number produces resources, i.e., each player that owns a building that borders the hex receives 1 resource per settlement / 2 resources per city

Settlers Requirements Elicitation

Who Interacts with the System?

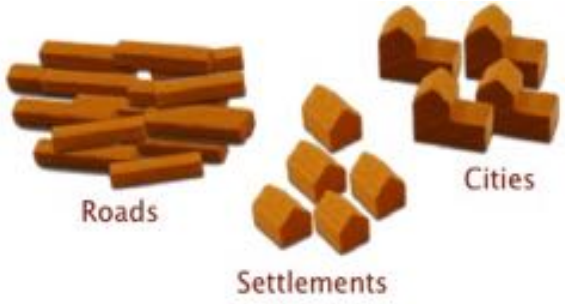
- Players take turns in
  - Rolling the dice → resources are distributed to all players
    - Unless a 7 is rolled, which activates the robber
  - Trade resources with other players
    - At any time resources can be traded with the bank at 4:1
    - Harbor settlements sometimes provide better trade
  - Build one or several of the following:
    - Road (lumber and brick)
    - Settlement (lumber, wool, brick, grain)
      New settlements must be connected by roads to other settlements
    - City (settlement + 3 ore and 2 grain)
    - Other cool things :)
  - Buy or use development and other special cards



Settlers Requirements Elicitation

Who Interacts with the System?

- Players take turns in
  - Rolling the dice → resources are distributed to all players
    - Unless a 7 is rolled, which activates the robber
  - Trade resources with other players
    - At any time resources can be traded with the bank at 4:1
    - Harbor settlements sometimes provide better trade
  - Build one or several of the following:
    - Road (lumber and brick)
    - Settlement (lumber, wool, brick, grain)
      New settlements must be connected by roads to other settlements
    - City (settlement + 3 ore and 2 grain)
    - Other cool things :)
  - Buy or use development and other special cards



What Are Their Goals?

Settlers Requirements Elicitation

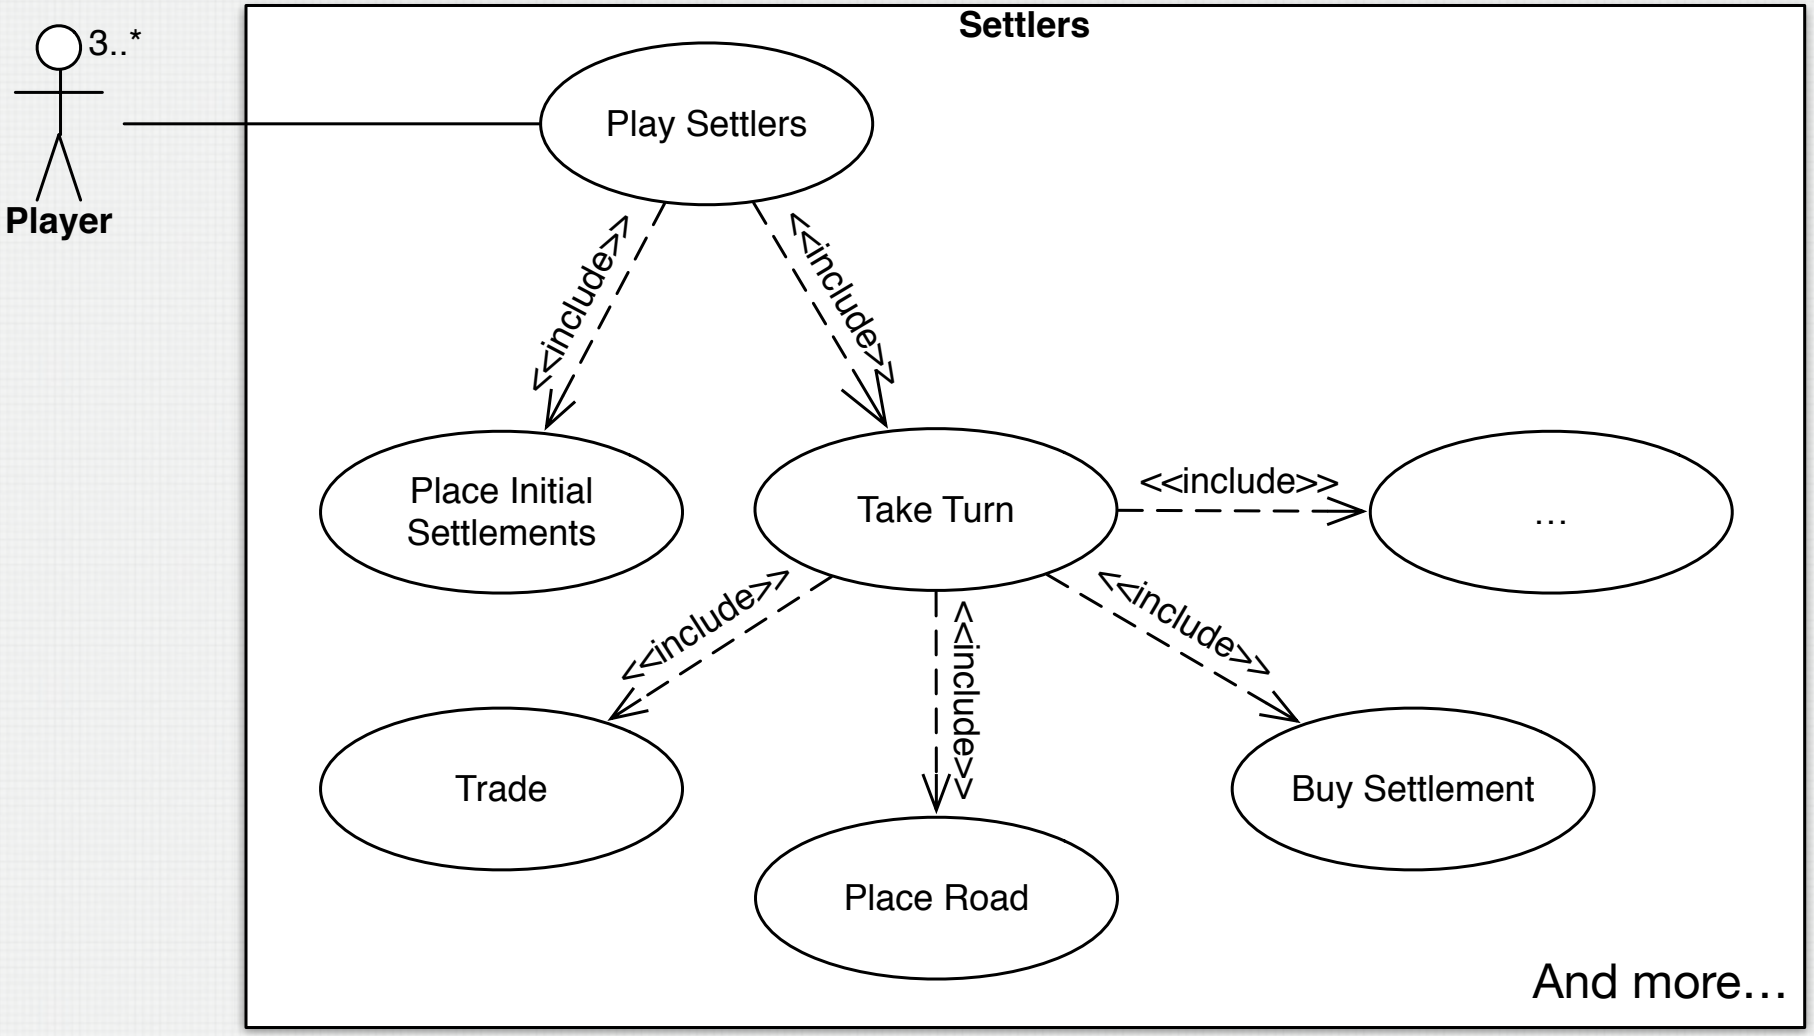
What Are Their Goals?

Settlers Use Case Model



Settlers Use Case Model

Use Case: Place Initial Settlements
Scope: Settlers System
Level: User Goal
Intention in Context: The intention of the Players is to setup a game of settlers by each placing a settlement and road, and a city and road.
Primary Actor: Player
Multiplicity: Only one instance of Place Initial Settlements happens per game.
Main Success Scenario:
System determines seating order of players.
Steps 1, 2 and 3 are repeated in sequence for each player in seating order.
1. *System* informs *Player* that it is his turn to place his first settlement and road.
2. *Player* informs *System* about where he wishes to place his first settlement and road.
3. *System* informs all *Players* about new game state.

Steps 4, 5 and 6 are repeated in sequence for each player in opposite seating order.
4. *System* informs *Player* that it is his turn to place his first city and road.
5. *Player* informs *System* about where he wishes to place his city and road.
6. *System* informs all *Players* abou

Describe Interaction Scenarios between Environment and System to achieve Goals

Settlers Requirements Elicitation

- The base game is played on a board of 19 hexagons
  - Hex fields produce resources: brick, lumber, wool, grain and ore
  - Each hex field has a number (between 2 and 12) on it
- Players build settlements on intersections, i.e., adjacent to 3 (or 2) hexes
  - Each player starts with 2 settlements
  - Upon rolling the dice, every hex with the corresponding number produces resources, i.e., each player that owns a building that borders the hex receives 1 resource per settlement / 2 resources per city

What are the Domain Concepts related to the System?

  - Each player starts with 2 settlements
  - Upon rolling the dice, every hex with the corresponding number produces resources, i.e., each player that owns a building that borders the hex receives 1 resource per settlement / 2 resources per city

What are the Domain Concepts related to the System?

What relationships exist between these concepts?

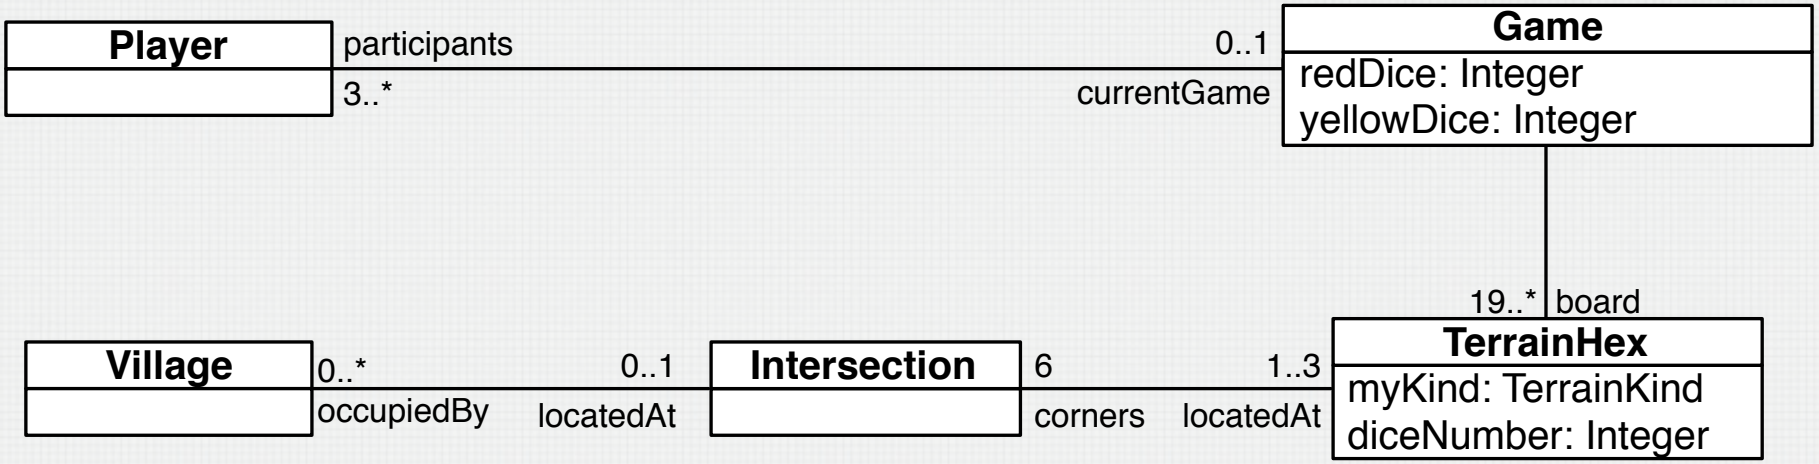
Settlers Requirements Elicitation

- The base game is played on a board of 19 hexagons
  - Hex fields produce resources: brick, lumber, wool, grain and ore
  - Each hex field has a number (between 2 and 12) on it
- Players build settlements on intersections, i.e., adjacent to 3 (or 2) hexes
  - Each player starts with 2 settlements
  - Upon rolling the dice, every hex with the corresponding number produces resources, i.e., each player that owns a building that borders the hex receives 1 resource per settlement / 2 resources per city

What are the Domain Concepts related to the System?

What relationships exist between these concepts?

Settlers Domain Model

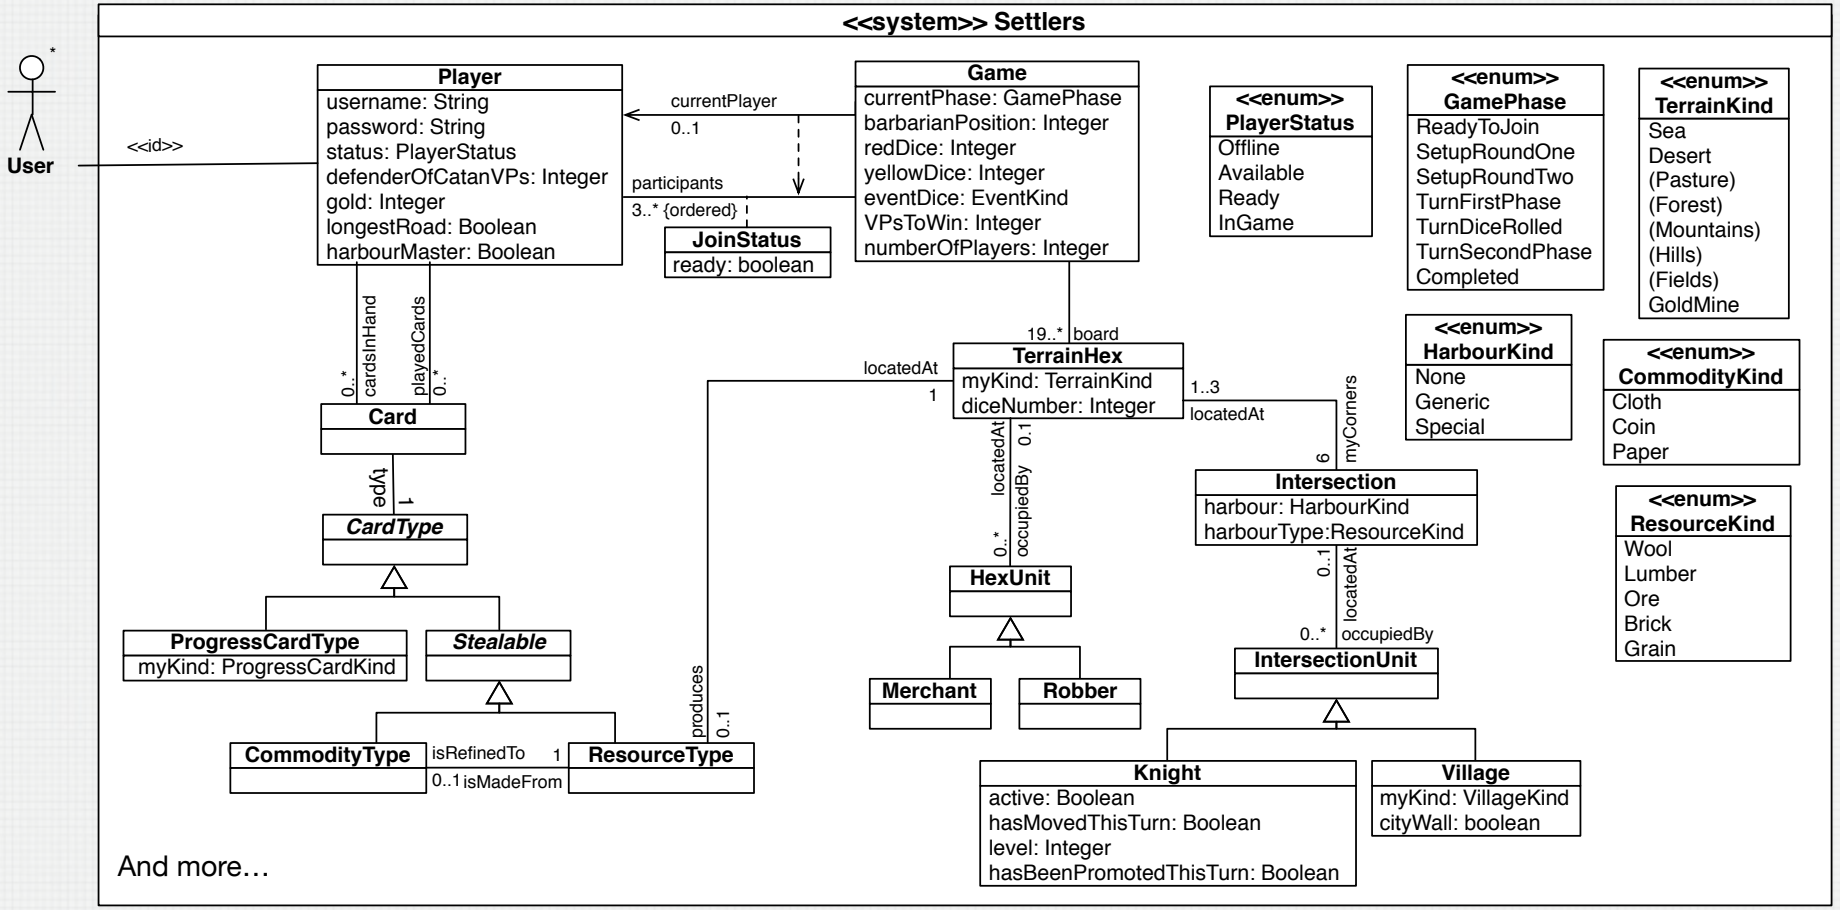


Capture concepts, their properties and their relationships related to the problem

Settlers Example Requirements Specification

- Based on the use case and domain model, a set of requirements specification models are produced, which describe the complete structural and behavioural properties of the Settlers system

Settlers Concept Model

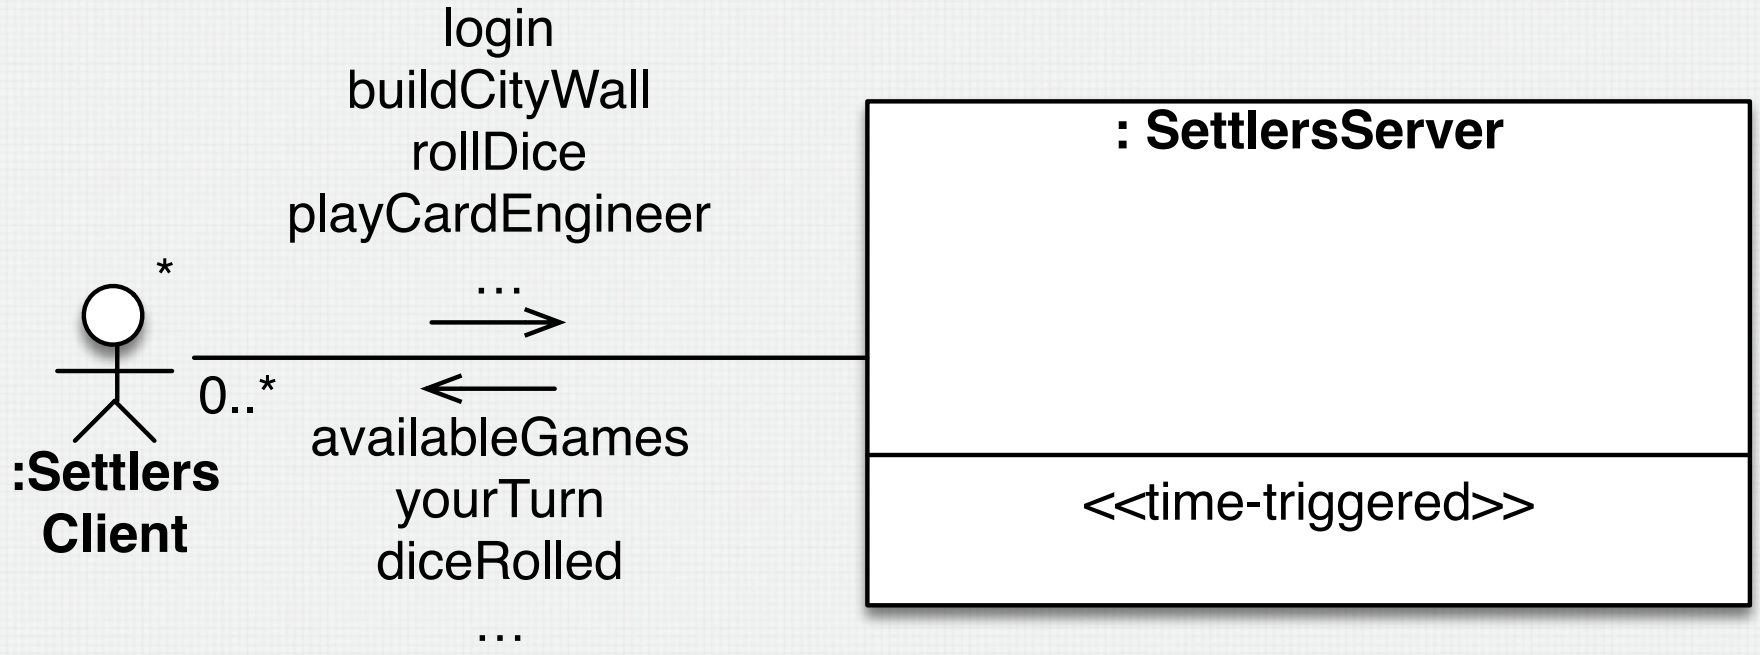


- Capture conceptual state of the system
- Define system boundary

Settlers Environment Model

Capture the interface of the system

- Inputs
- Outputs



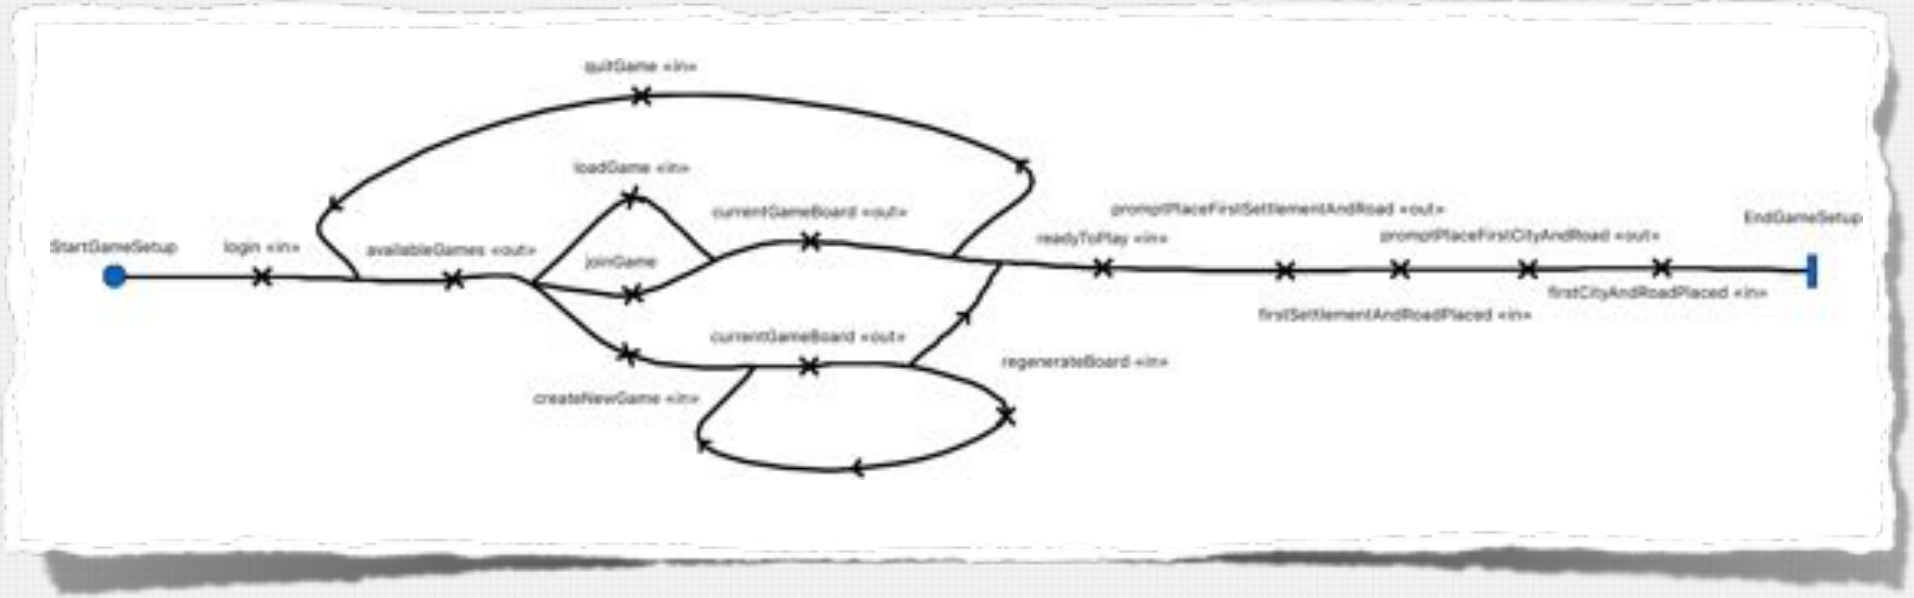
Settlers Operation Model

Operation: Settlers::endMyTurn()
Scope:
Game, Player, Knight;
Messages:
Player::{yourTurn}
Description: The effects of the *endMyTurn* operation is to determine which player is up next, set him as the current player, and notify him with the *yourTurn* message. Also, the *hasMovedThisTurn* and *hasBeenPromoted* state of all the knights of the new current player are updated to false. Finally, the *gamePhase* is set to *turnFirstPhase*.

Describes the effects of each system operation (triggered by input) on the conceptual system state

Settlers Protocol Model

Capture the allowable sequencing of system operation calls, i.e., the interaction protocol



Settlers Example Design

- Based on the requirement models, the designer chooses how the effects of the system operations are to be implemented by interacting objects at run-time

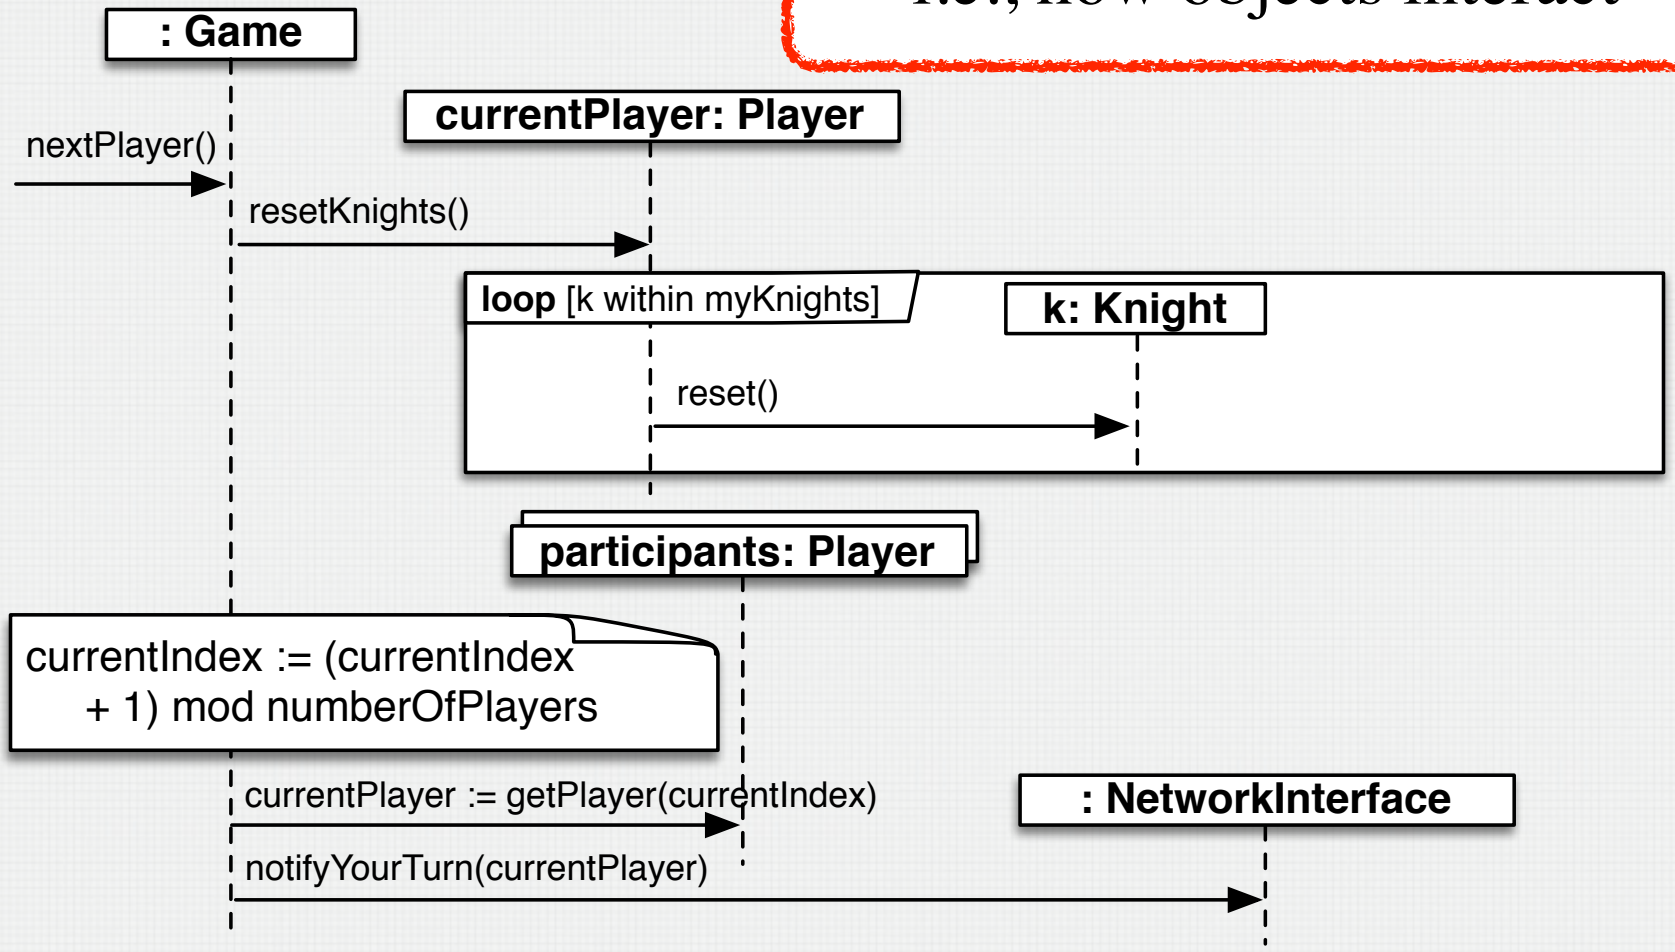
➡ Design state (classes and attributes)

➡ Design relationships (associations (references))

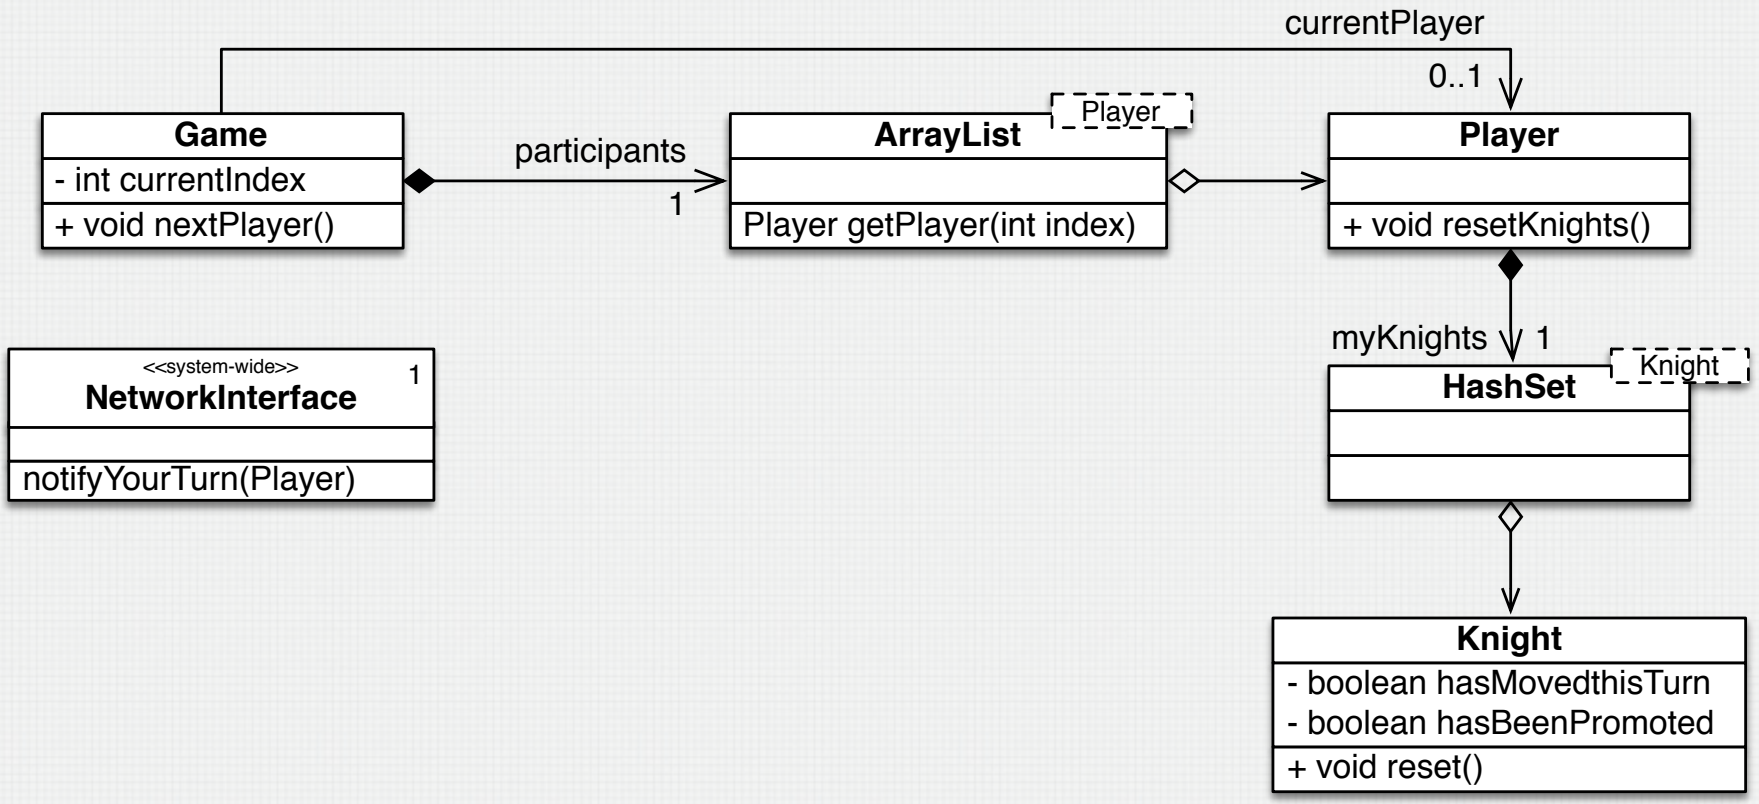
➡ Control flow

Settlers Interaction Model

Describe behavioural design of each system operation, i.e., how objects interact



Settlers Interaction Model



Capture the design state of the system, the permanent associations between classes and containment relationships

FONDUE SUMMARY
